

## MULTISPECTRAL REMOTE SENSING

Master's Degree in Geospatial Engineering

### LABORATORY PROJECT 1

| <b>MACHINE LEARNING FOR LAND USE AND LAND COVER MAPPING USING SENTINEL-2 TIME SERIES</b> |  |
|--|--|
| <b>OBJECTIVE</b>   | Develop a complete workflow for the production of a LULC map for a selected area in mainland Portugal using Sentinel-2 imagery from 2023 and machine learning algorithms implemented in Python (scikit-learn)  |
| <b>DURATION</b>  | 3 March 2026 – 1 April 2026  |
| <b>EVALUATION</b>  | Oral presentation – 21 April 2026  |

## LULC mapping workflow

|  |   |
|--|---|
| <p><b>STEP 1</b></p> <p><b>Area of interest (AOI) definition and data collection</b></p> | <p><b>1.1 Define the AOI</b></p> <p>Identify a representative region within mainland Portugal</p> <p>Ensure land cover types diversity (urban, agriculture, forest, water, shrubs, etc.)</p> <p><b>1.2 Download Sentinel-2 Level-2A Images (Copernicus/ESA)</b></p> <p>Year = 2023</p> <p>Cloud cover &lt; 10%</p> <p>At least 8 acquisition dates well distributed across seasons (Winter/Spring/Summer/Autumn)</p> <p><b>1.3 Additional datasets for reference and training</b></p> <p>COS2023</p> <p>COSc2023</p> <p>OrtoSat 2023</p> <p>LPIS 2023</p>   |
| <p><b>STEP 2</b></p> <p><b>Sentinel-2 time series generation</b></p>                     | <p><b>2.1 Preprocessing</b></p> <p>Atmospheric correction (already applied for Level-2A)</p> <p>Cloud and shadow masking (using SCL band)</p> <p>Resampling to a common spatial resolution (10 m)</p> <p><b>2.2 Variables to include (spectral bands and derived features)</b></p> <p><b>Original spectral bands</b></p> <p>B2, B3, B4, B8 (10 m)</p> <p>B5, B6, B7, B8A, B11, B12 (20 m)</p> <p><b>Spectral indices</b></p> <p>NDVI, EVI, NDWI, NBR, NDMI</p> <p>Red-edge indices (RENDVI, Cired-edge, NDVIre)</p> <p>Built-up index (NDBI)</p> <p><b>Texture measures (useful for urban/agriculture separation)</b></p> <p>GLCM variance, homogeneity, contrast (based on NDVI or specific bands, <i>such as B8 or B11</i>)</p> <p><b>Temporal metrics (for each pixel over 2023)</b></p> <p>min, max, mean, median, <i>standard deviation</i> of each index</p> <p>percentiles (10, 25, 75, 90)</p> <p><i>NDVI annual</i> amplitude</p> <p><b>2.3 Construction of the time series cube</b></p> <p>Stack all dates <i>and all</i> derived layers into a single multidimensional dataset</p> <p>Export as a raster stack (GeoTIFF) or <i>NumPy</i> array for use in Python</p> |

|   |   |
|---|---|
| <p><b>STEP 3</b></p> <p><b>Nomenclature definition and samples generation</b></p>             | <p><b>3.1 Nomenclature</b></p> <p>Use 8 classes as in the Level 1/2 of the COSc2023 nomenclature<sup>1</sup>:</p> <ul style="list-style-type: none"> <li>10. Artificial surfaces</li> <li>21. Agriculture</li> <li>30. Forest</li> <li>41. Shrubs</li> <li>42. Herbaceous spontaneous vegetation</li> <li>50. Bare soil</li> <li>61. Wetlands</li> <li>62. Water</li> </ul> <p><b>3.2 Sampling generation</b></p> <p>Use polygons from COS/LPIS, but keep samples well inside polygons (buffer inward 20 m to avoid mixed pixels)</p> <p>Generate 2 random points inside each polygon to generate a minimum of 300 to 500 points per class (buffer outward 40 m and compute the median)</p> |
| <p><b>STEP 4</b></p> <p><b>Feature values extraction at samples</b></p>                       | <p><b>4.1 Verify that the samples are in the same CRS as the stack</b></p> <p>Set the CRS as EPSG: 32629 - WGS84/UTM zone 29N</p> <p><b>4.2 Use Python to sample the raster stack values at points</b></p> <p>Overlay the sample points on the Sentinel-2 time-series stack to extract all feature values for every acquisition date (and any extra metrics) into a table</p> <p><b>4.3 Create a table</b></p> <p>Columns = features (as many as features in the stack)</p> <p>Target column= class label (10, 21, 30, 41, 42, ..., 62)</p> <p>Optional columns = Easting, Northing</p> <p>Rows = points (as many as the sample points)</p>   |
| <p><b>STEP 5</b></p> <p><b>Three machine learning (ML) models training (scikit-learn)</b></p> | <p><b>5.1 Choose at least 3 ML models</b></p> <p><b>Some ML model examples</b></p> <ul style="list-style-type: none"> <li>RandomForestClassifier</li> <li>Gradient Boosting</li> <li>SupportVectorMachine (SVM): this model requires StandardScaler</li> </ul> <p><b>5.2 Split rule</b></p> <p>75% train / 25% test, but do it in a spatially-aware way</p> <p><b>5.3 Class weighting and cross-validation</b></p> <p>Use class_weight="balanced" when classes are imbalanced</p> <p>Use cross-validation (even 3-fold) for hyperparameter sanity</p>   |

|   |  |
|---|--|
| <p><b>STEP 6</b></p> <p><b>Time series classification</b></p> | <p><b>6.1 Read the raster stack and reshape it to n_pixels x n_features</b></p> <p>Convert the raster time series stack into a two-dimensional feature matrix to apply the trained machine learning models to all pixels in the study area</p> <p><b>6.2 Write the prediction GeoTIFF</b></p> <p>Convert the classification results back to raster format and export as a GeoTIFF to produce the final LULC map</p> <p><b>6.3 Compute class membership (optional) and write probability GeoTIFF</b></p> <p>Compute class membership probabilities using the trained model and export as a multi-band GeoTIFF, where each band represents the likelihood of a given land cover class for every pixel</p>  |
| <p><b>STEP 7</b></p> <p><b>Accuracy assessment</b></p>        | <p><b>7.1 Compute accuracy metrics based on the held-out 25% test samples</b></p> <p>Confusion matrix<br/>Overall accuracy<br/>Precision, Recall, F1-score per class<br/>Macro and weighted F1-scores<br/>Samples per class</p>  |
| <p><b>STEP 8</b></p> <p><b>Final map production</b></p>       | <p><b>8.1 Choose the model with best macro F1</b></p> <p>Select the model with the highest macro F1-score as the final classifier, ensuring balanced performance across all land cover classes regardless of class size</p> <p><b>8.2 Import the final GeoTIFF to QGIS</b></p> <p>Import the selected classification result into QGIS for visualization, cartographic refinement, and final map production<br/>Apply post-classification spatial filtering (majority or sieve filter) to reduce the salt-and-pepper effect and improve the visual coherence of homogeneous land cover areas</p> <p><b>8.3 Use map layout in QGIS</b></p> <p>Use the QGIS Layout Manager to design the final cartographic product, ensuring clear visualization and professional presentation of the classification results<br/>Legend with class names/colors<br/>Scale bar, north arrow, title<br/>Small inset of Portugal + AOI footprint<br/>Accuracy summary box (OA + macro F1)</p> |
