■ Active
■ Non-Active

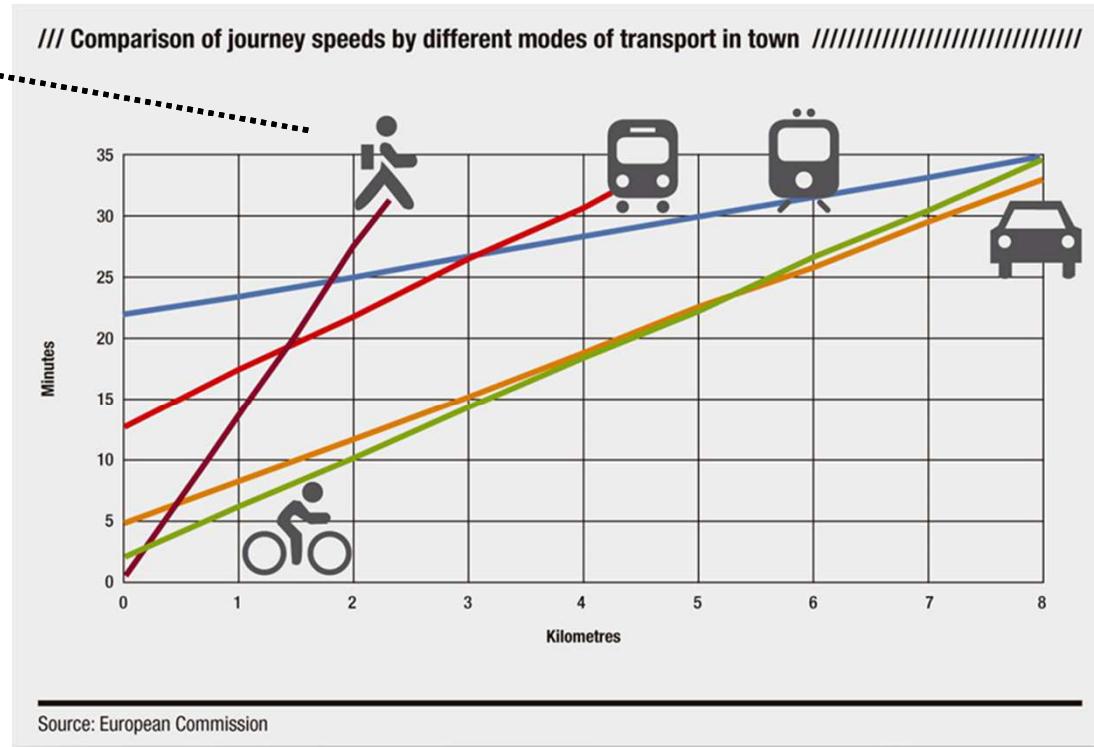

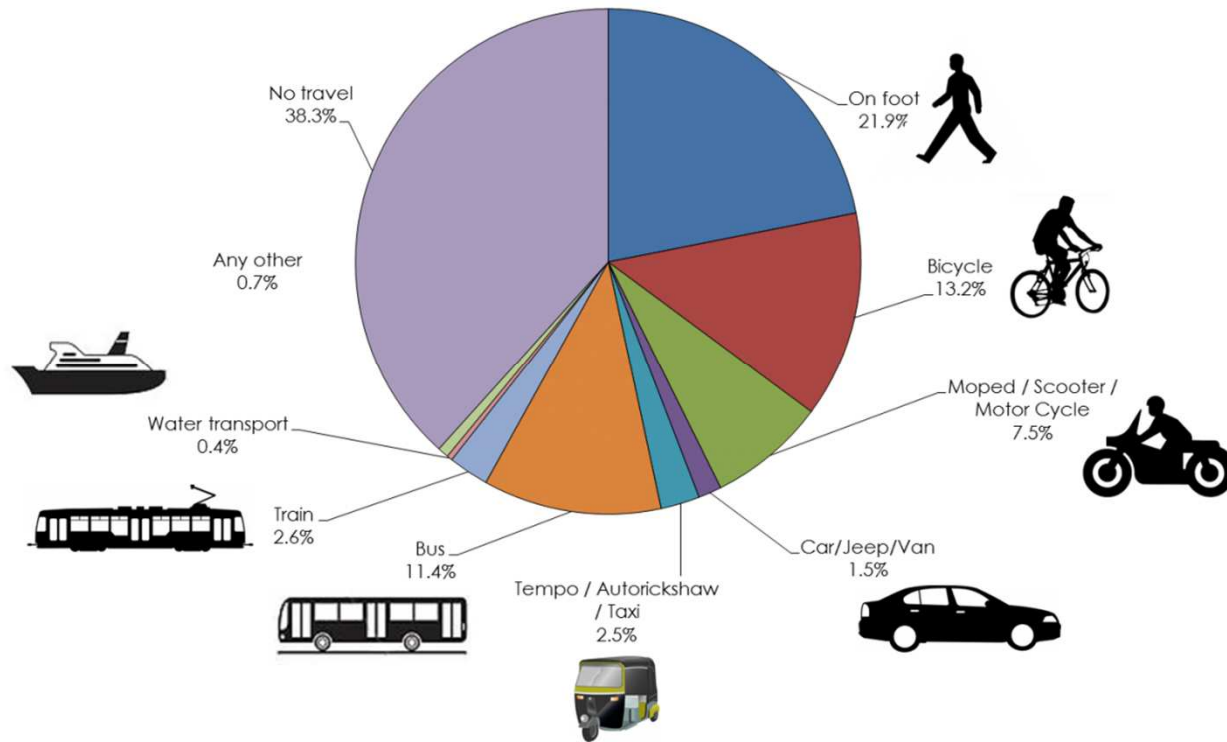

Active = Soft modes = bike + walking

@ Impact of travel mode shift and trip distance on active and non-active transportation in the São Paulo Metropolitan Area in Brazil, Preventive Medicine Reports Volume 2, 2015, Pages 183–188

~ 4.5 km/h

Travel to work by modes of transport, 2011.

100% = 200.4 million.

Surveys....

Surveys....

How people travel?

The image shows the cover of a survey form titled "National Travel Survey". At the top left, it says "Department for Transport" and "NatCen Social Research". Below that, it says "In confidence". The title "National Travel Survey" is prominently displayed in the center. Below the title, there is a section for "Travel record of" followed by a blank line. Underneath, there are two columns of input fields: "Start date" and "End date" on the left, and "Start time" and "End time" on the right. At the bottom, there is a section for "Your address" with fields for "Day", "Evening", "Night", "Weekend", and "Time". A note at the bottom says "Please use black or blue ink if possible" and "Thank you very much for your help".

Google Forms

How people travel?

How people travel?

Area = 1

2. The area to the left of $z = 1.23$ is 0.8907

1. Use the table to find the area for the z -score

How people travel? Origin –Destination

How many respondents?

$$Sample\ Size = \frac{\frac{z^2 \times p(1-p)}{e^2}}{1 + \left(\frac{z^2 \times p(1-p)}{e^2 N}\right)}$$

N= total population (small size)

Z = confidence level (90%, 99%, 95%)

e = margin of error (e.g. 5% input 0.05)

p= 50% (estimative of answer, 0.5)

N > 100.000 individuals \Rightarrow Sample size

$$\frac{z^2 \times p(1-p)}{e^2}$$

How many respondents?

margin of error (or confidence intervals)

Suppose in your survey 40% of the respondents pick a certain answer and your margin of error is 2%. This would mean that if you interrogate the total population, you can be sure that between 38% and 42% would pick the same answer

How many respondents?

Confidence level 90% -> $Z=1.645$

Confidence level 95% -> $Z=1.96$

Confidence level 99% -> $Z=2.575$

Confidence level

How often the actual percentage of the population that picks a certain answer, lies within the margin of error. In market research, margins of error are calculated generally for a confidence level of **95%**.

How people travel? Origin –Destination

How many respondents?

Respondents Needed at Error of ±3%, ±5%, & ±10%			
Population	±3%	±5%	±10%
500	345	220	80
1,000	525	285	90
3,000	810	350	100
5,000	910	370	100
10,000	1,000	385	100
100,000	1,100	400	100
1,000,000	1,100	400	100
10,000,000	1,110	400	100

N > 100 000

$$\frac{z^2 \times p(1-p)}{e^2}$$

Your survey results are meanfull for FCUL population?

FCUL population 5849

- Professors
- Researchers
- Non-Academic Staff
- Grantees

- Undergraduate
- Undergraduate+MSc
- MSc
- PhD

- M
- F

Your survey results are meaningful for FCUL population, respondents 23?

FCUL population $N=5849 < 100\,000 \Rightarrow$

$$\text{Sample Size} = \frac{\frac{z^2 \times p(1-p)}{e^2}}{1 + \left(\frac{z^2 \times p(1-p)}{e^2 N}\right)}$$

Several questions for example: **Willing to use an Autonomous Vehicle?**

1. Margin or error, i.e., expect the population answer will be in 2% of the sample's **$e=0.02$**
2. We think the answer would be 50% chance of yes or no **$p=0.5$**
3. Level of confidence, i.e., 95% chance of population answers fall within the margin of error **$Z=1.96$**

Z	1.96
p	0.5
e	0.02
N	5849
Sample size	1702.236

$$\text{Sample Size} = \frac{\frac{z^2 \times p(1-p)}{e^2}}{1 + \left(\frac{z^2 \times p(1-p)}{e^2 N}\right)}$$

Z	1.96
p	0.5
e	0.1
N	5849
Sample size	94.48

Z	1.645
p	0.5
e	0.1
N	5849
