Using a 25-year record of satellite observations over the Getz region in West Antarctica, scientists have discovered that the pace at which glaciers flow towards the ocean is accelerating. This new research, which includes data from the Copernicus Sentinel-1 mission and ESA's CryoSat mission, will help determine if these glaciers could collapse in the next few decades and how this would affect future global sea-level rise.

Ice lost from Antarctica frequently hits the headlines, but this is the first time that scientists have studied this particular area in depth.

Led by scientists at the University of Leeds in the UK, the new research shows that between 1994 and 2018, all 14 glaciers in Getz accelerated, on average, by almost 25%, with three glaciers accelerating by over 44%.

The results, published today in *Nature Communications*, also reported that the glaciers lost a total of 315 gigatonnes of ice, adding 0.9 mm to global mean sea level – equivalent to 126 million Olympic swimming pools of water.

Journey to Destination Earth begins

Destination Earth initiative: an ambitious project that involves creating a digital replica of Earth to help us move towards a sustainable future.

Journey to Destination Earth begins

30 Março 2022.

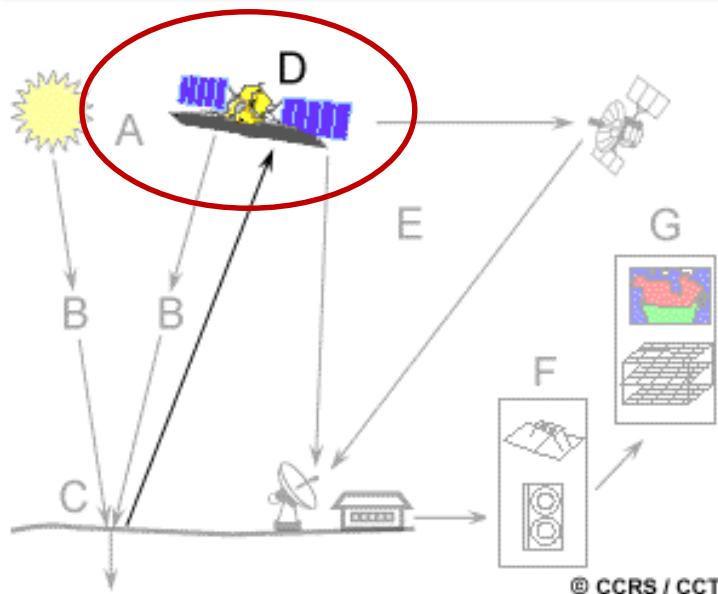

Today,
the European Commission, ESA,
the European Centre for Medium-Range Weather Forecasts (ECMWF) and
the European Organisation for the Exploitation of Meteorological Satellites (Eumetsat)

celebrated the official launch of the **Destination Earth** initiative: an ambitious project that involves creating a digital replica of Earth to help us move towards a sustainable future.

Destination Earth (DestinE), led by the European Commission's DG Connect, aims to develop a highly accurate digital model of Earth that will monitor and predict environmental change and human impact. Using innovative Earth system models, cutting-edge computing, satellite data and machine learning, DestinE will allow its users to explore the effects of climate change on the different components of the Earth system, together with possible adaptation and mitigation strategies.

Satélites / Sensores Meteorológicos

A monitorização e previsão do tempo foi uma das primeiras aplicações civis da detecção remota com satélites.

TIROS-1 : 1960, EUA.

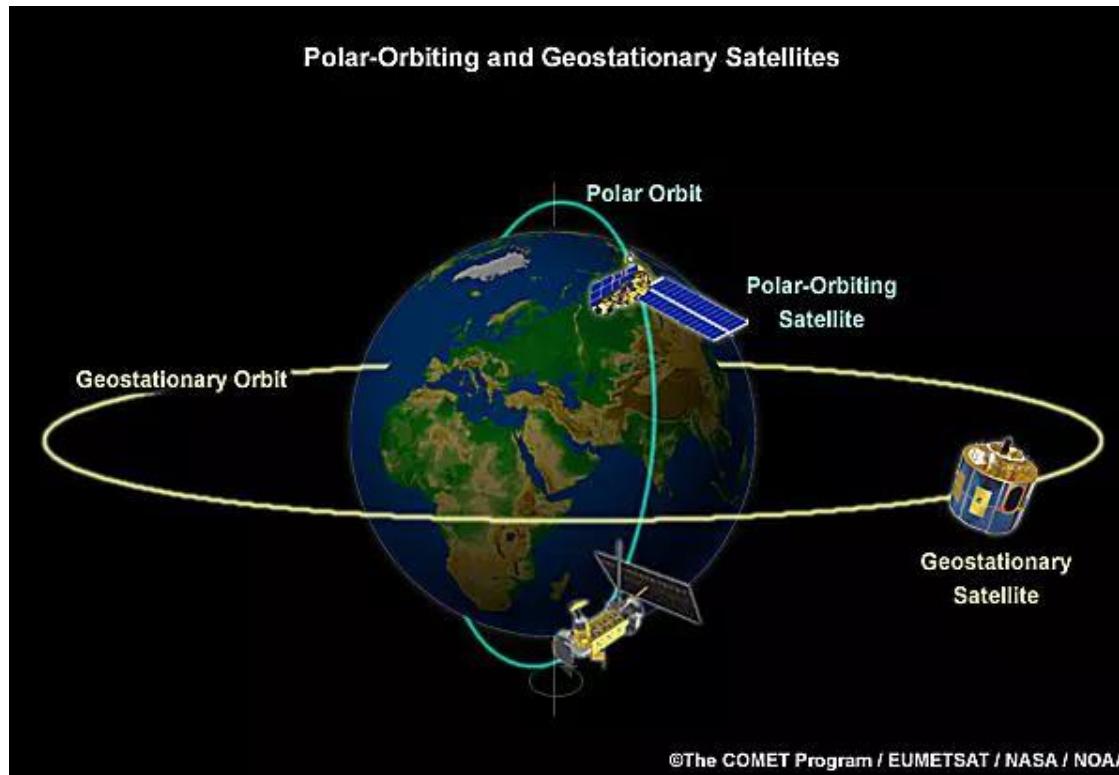

(Television and Infrared Observation Satellite-1)

ATS-1, 1966, NASA. Satélite geoestacionário que fornecia imagens hemisféricas da superfície da Terra e cobertura de nuvens a cada meia hora.

A resolução temporal dos satélites meteorológicos é bastante elevada e a sua resolução espacial bastante grosseira (comparada com os satélites de Observação da Terra)

Weather Satellites

There are two kinds of weather satellites, **geostationary** and **polar orbiting**, each is best at detecting different types of weather events.

Weather Satellites

Weather satellite are primarily used to monitor the weather and climate of the Earth. Satellites can be **polar orbiting**, covering the entire Earth asynchronously, or **geostationary**, flying over the same spot on the equator.

Meteorological satellites monitor **clouds** and **cloud systems** (such as hurricanes), but are also used to monitor **environmental events** that interact with the atmosphere and have broad areal coverage, such as wildfires, volcanic ash clouds, dust storms, snow cover, sea ice, and ocean temperatures.

Weather Satellites

Some current operational weather satellites

Actors	Satellites	Orbit	Orbital Position
US	GOES-R Series	Geostationary	Western hemisphere
NOAA/NASA	JPSS-1 Mission	Polar-orbiting	Global coverage
Europe	MSG Series	Geostationary	Europe, Africa and the Indian Ocean
EUMETSAT/ESA	EPS-SG Series	Polar-orbiting	Global coverage

EUMETSAT

GOES (Geostationary Operational Environmental Satellite)

Imagen de um furacão EUA, Setembro de 1996

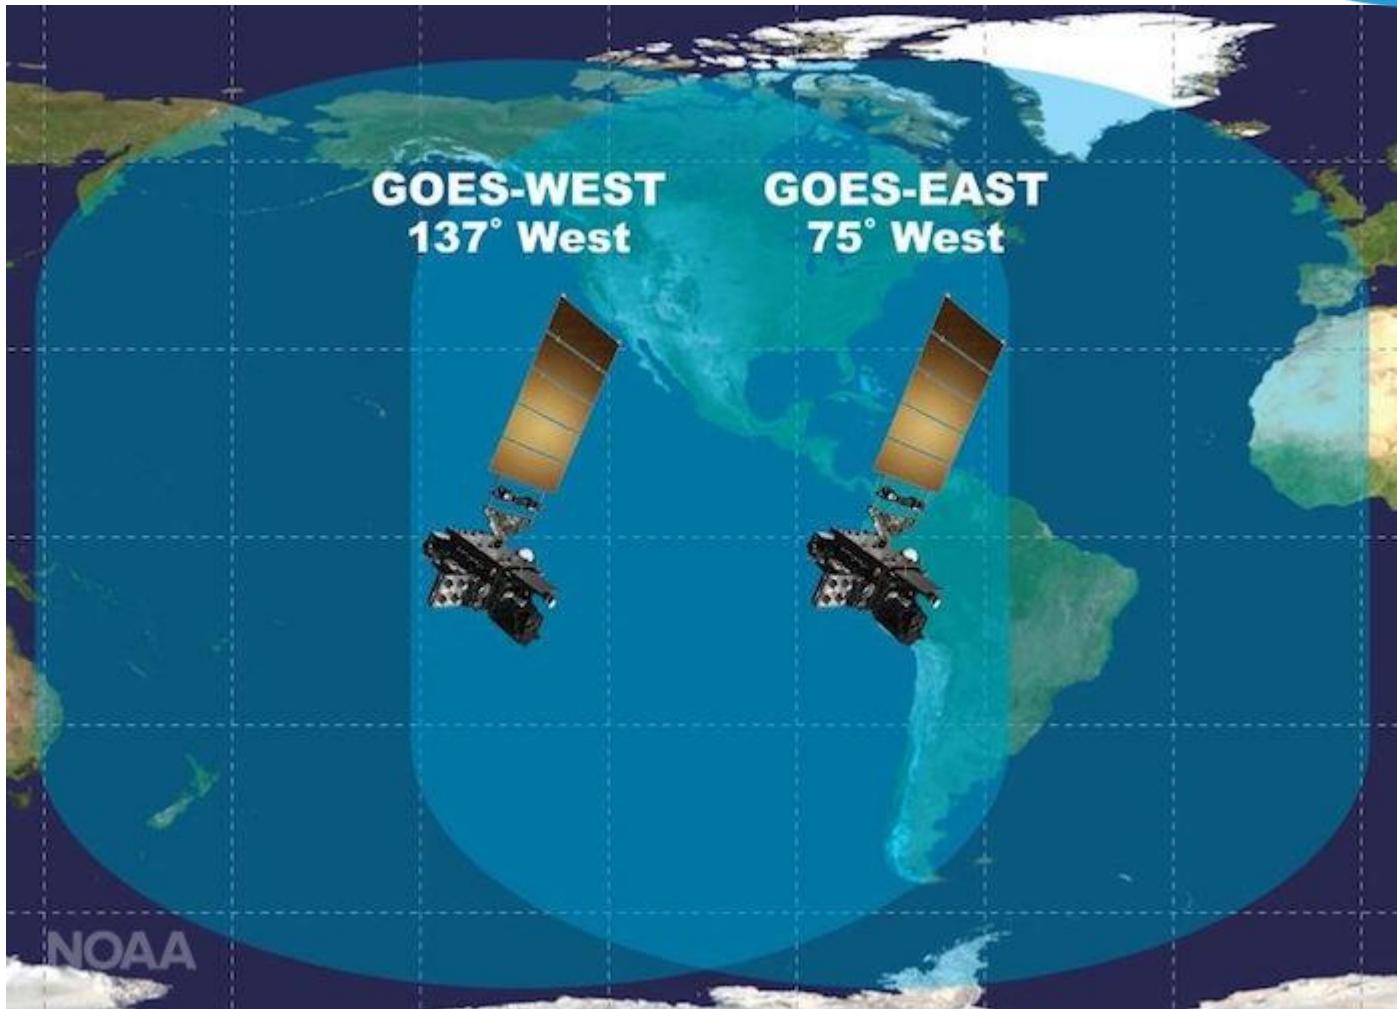

O sistema GOES é o seguidor da série ATS.

Fornece imagens frequentes de pequena escala da superfície da Terra e da cobertura de nuvens.

Estes satélites fazem parte de uma rede de satélites separados 70° em longitude que fornecem uma cobertura permanente da América.

Weather Satellites

GOES

Os dois satélites GOES colocados em órbitas geoestacionárias a 36000 km sobre o equador cobrem um terço da Terra.

Um está situado a 75º W e monitoriza o norte e sul da América e parte do Oceano Atlântico. O outro está situado a 135º W e monitoriza o norte da América e o Oceano Pacífico. Em conjunto cobrem a área de 20ºW a 165 E.

Foram lançadas duas gerações dos satélites GOES ambas medindo a radiação emitida e reflectida a partir da qual se pode determinar:

- a temperatura da atmosfera,
- ventos e
- cobertura de nuvens.

GOES - Bandas

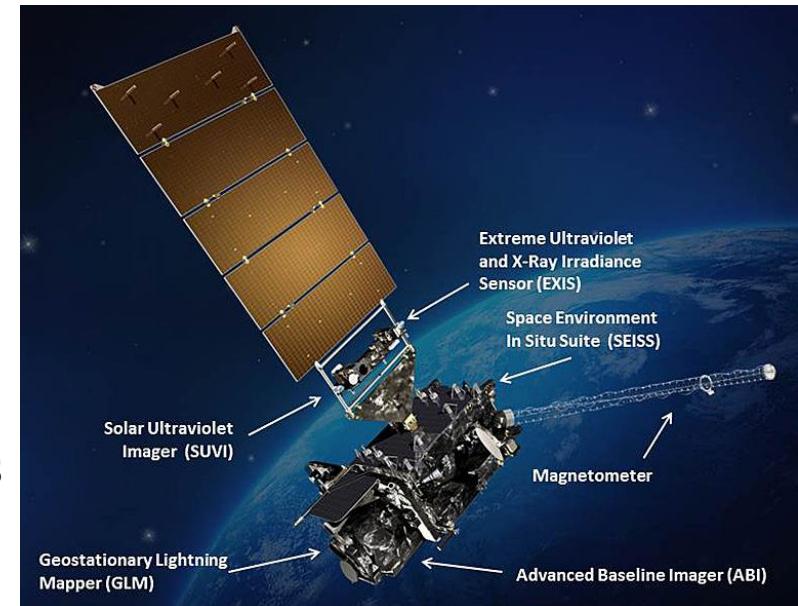

Band	Wavelength Range (> μm)	Spatial Resolution	Application
1	0.52 - 0.72 (visible)	1 km	cloud, pollution, and haze detection; severe storm identification
2	3.78 - 4.03 (shortwave IR)	4 km	identification of fog at night; discriminating water clouds and snow or ice clouds during daytime; detecting fires and volcanoes; night time determination of sea surface temperatures
3	6.47 - 7.02 (upper level water vapour)	4 km	estimating regions of mid-level moisture content and advection; tracking mid-level atmospheric motion
4	10.2 - 11.2 (longwave IR)	4 km	identifying cloud-drift winds, severe storms, and heavy rainfall
5	11.5 - 12.5 (IR window sensitive to water vapour)	4 km	identification of low-level moisture; determination of sea surface temperature; detection of airborne dust and volcanic ash

Weather Satellites

The **Advanced Baseline Imager (ABI)** is the primary instrument on the GOES-R Series spacecraft for imaging Earth's weather, oceans and environment.

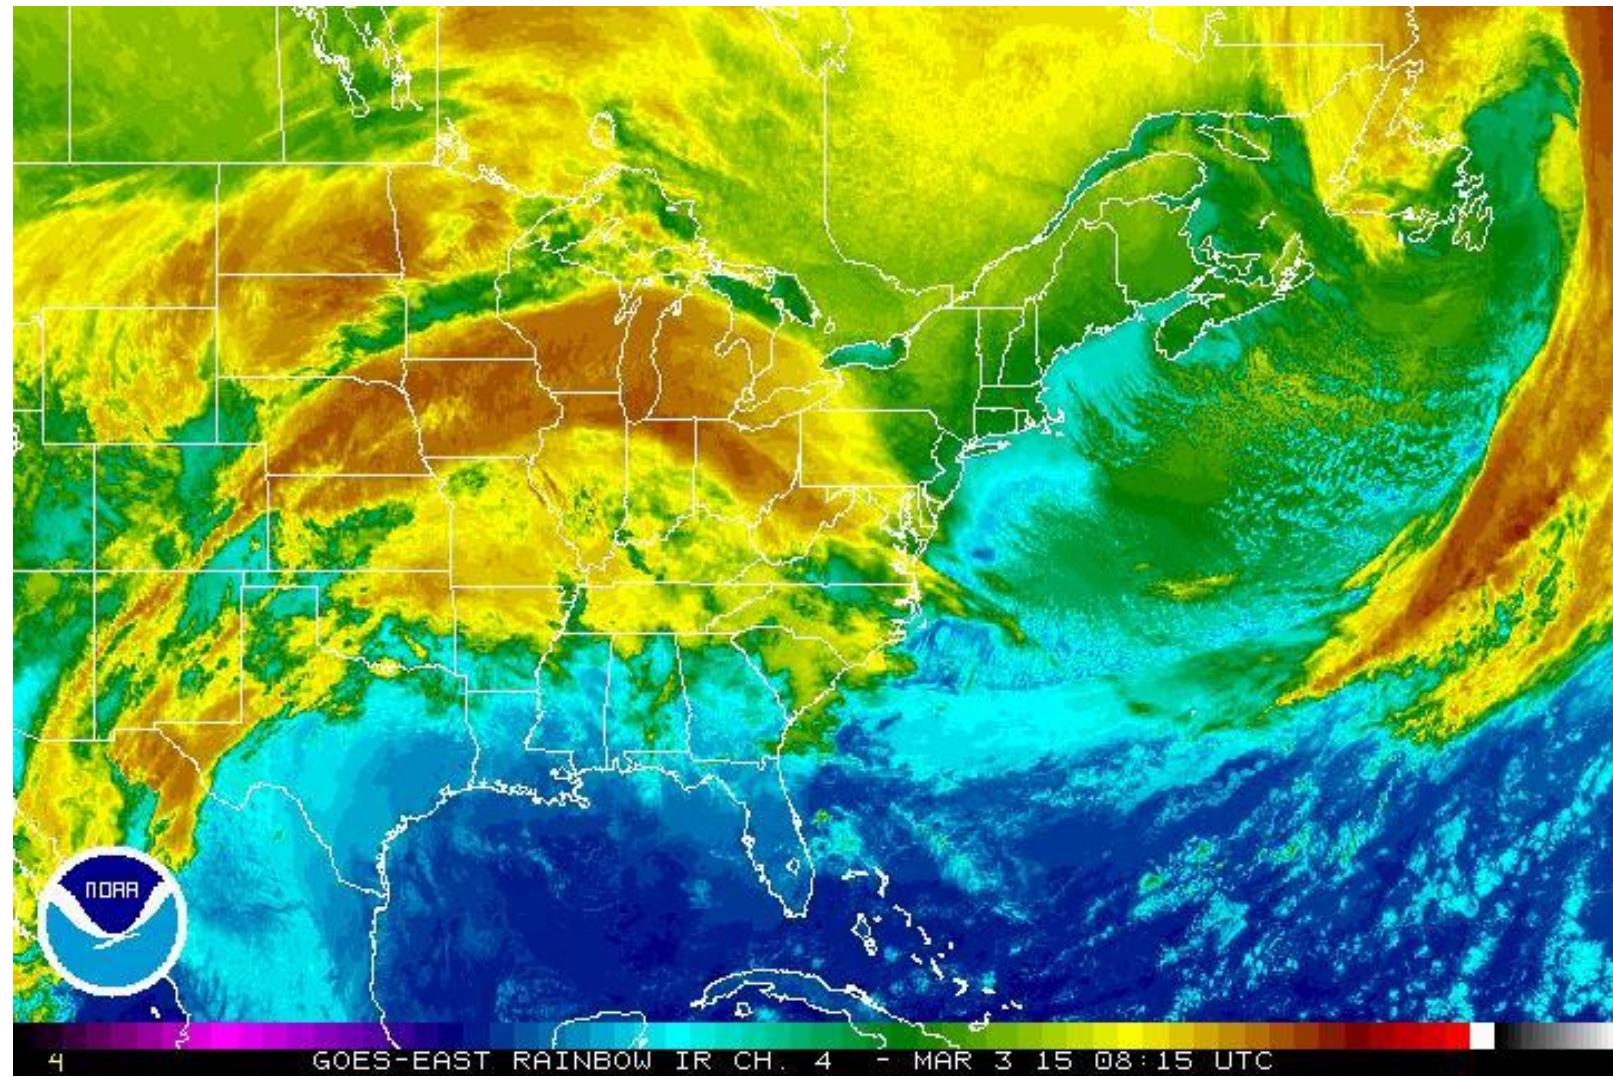

ABI views Earth with **16 spectral bands** (compared to five on previous GOES), including two visible channels, four near-infrared channels, and ten infrared channels. It provides three times more spectral information, four times the spatial resolution (1km), and five times faster coverage than previous GOES.

A **NOAA** é responsável por outra série de satélites usados em aplicações meteorológicas, os NOAA-1..-15.

Estes satélites têm órbitas heliosíncronas, quase polares a cerca de 830-870 km sobre a superfície e são a continuação da série TIROS e fornecem informação complementar ao sistema GOES.

Dois satélites cada um com cobertura global garantem que qualquer região da Terra é observada no máximo cada 6 horas. Um satélite cruza o equador no final da manhã de norte para sul e o outro cruza o equador no final da tarde.

O sensor a bordo deste satélite é o:

Meteosat Second Generation (MSG)

O MSG é um projecto conjunto entre a ESA e o EUMETSAT (European Organisation for the Exploitation of Meteorological Satellites) consiste numa série de 4 satélites meteorológicos geoestacionários que está operacional desde 2021.

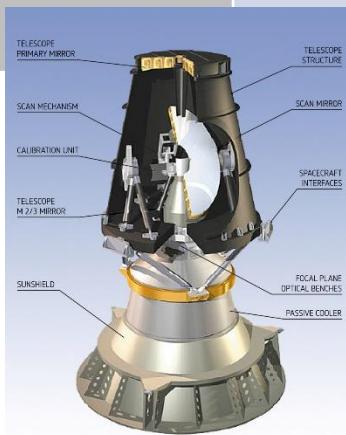

Estes satélites têm dois instrumentos:

SERIVI (Spinning Enhanced Visible and InfraRed Imager) com 12 canais espectrais. Tem como objectivo a previsão meteorológica.

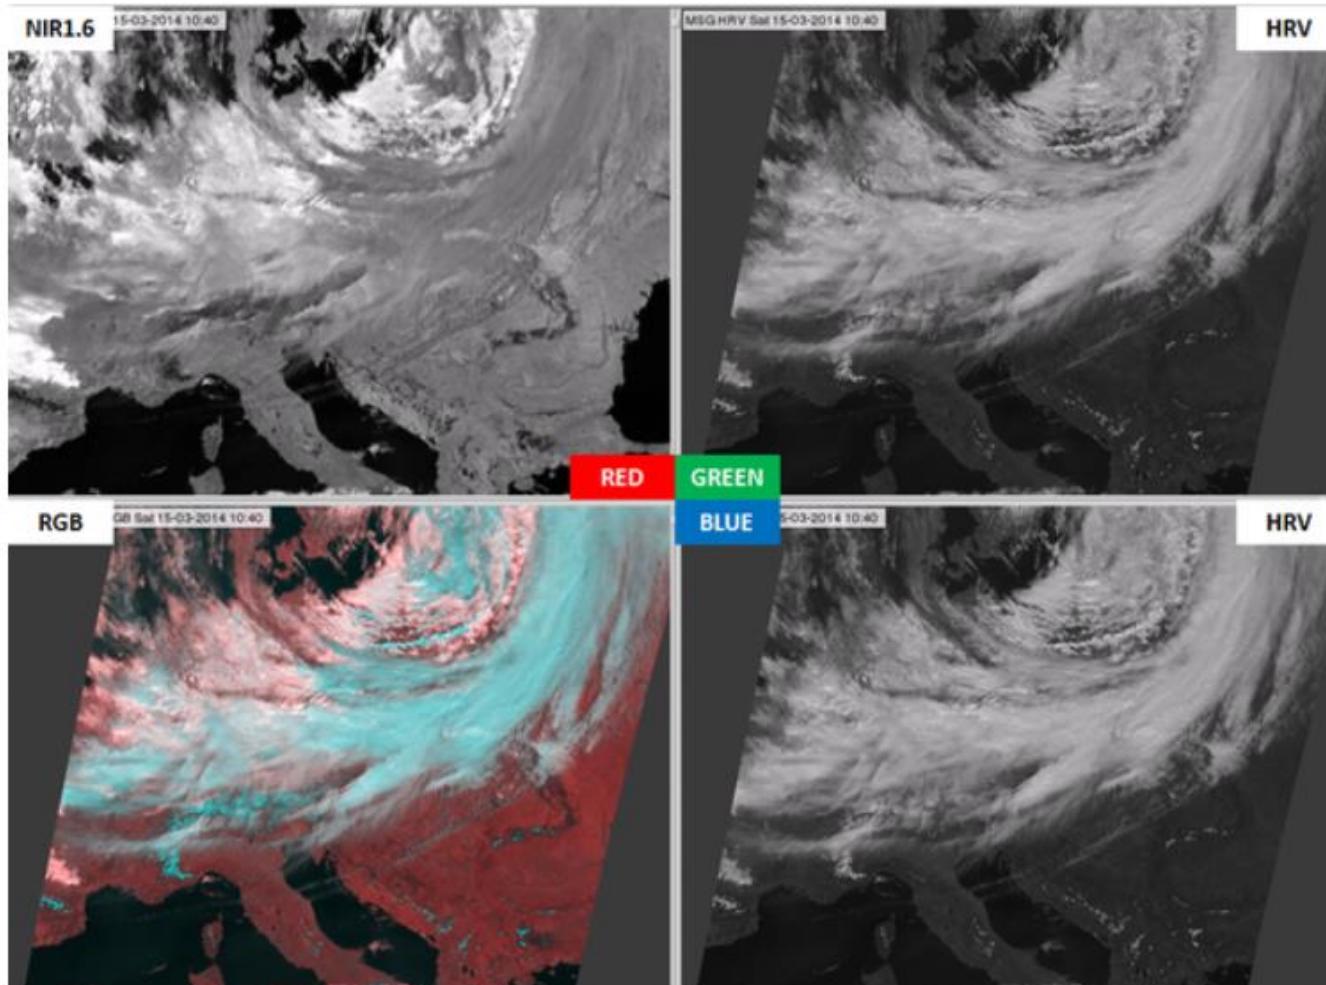

GERB (Geostationary Earth Radiation Budget) que suporta estudos climáticos

Weather Satellites

Instrument	Spectral coverage	Resolution	Mission
SEVIRI Spinning Enhanced Visible and InfraRed Imager	8 bands in the thermal infrared from 3.9 to 13.4 μm	3 km	Provide permanent data about the temperatures of clouds, land and sea surfaces
	4 visible/NIR bands from 0.4 to 1.6 μm	1 km for the high resolution visible band 3 km for the NIR and the 3 other visible bands	NIR allows to discriminate clouds from snow and water clouds from ice clouds. In combination with the 2 visible bands VIS0.6 and VIS0.8, it improves the observation of aerosol, soil moisture and vegetation index.

MetOp é o primeiro satélite europeu de órbita polar dedicado à meteorologia.

MetOp é uma série de 3 satélites a ser lançado sequencialmente em 14 anos consistindo no segmento do espaço do EUMETSAT's Polar System (EPS).

O primeiro foi lançado em 2006 (A) e o segundo em 2012 (B) e o C foi lançado em 2018.

Sun-synchronous orbit, 09.30 mean local solar time
Inclination, 98.7 degrees to the Equator
Time for one orbit, 101 minutes
Repeat cycle, 29 days
Mean altitude Approximately 817 km

Instrument	
IASI Infrared Atmospheric Sounding Interferometer	Infrared Michelson Interferometer for temperature sounding, water vapour, and ozone monitoring. IASI covers the spectral range from 3.62-15.5 μm , 2112 km swath width and a resolution of 12 km at nadir.
AMSU-A Advanced Microwave Sounding Unit A1 and A2	Microwave sounder for temperature sounding under clear and overcast conditions, 15 channels in the 23 to 90 GHz frequency range.
MHS Microwave Humidity Sounder	MHS is a self-calibrating, cross-track scanning, five-channel microwave, full-power radiometer operating in the 89 to 190 GHz range to provide information on atmospheric water vapour.
HIRS High Resolution Infrared Radiation sounder/4	Atmospheric Sounder for temperature and humidity profiles, surface temperature, cloud parameters and total ozone, 19 infrared channels (3.8-15 μm), one visible channel.

Instrument	
GOME-2 Global Ozone Monitoring Experiment-2	Nadir viewing UV and visible spectrometer to measure radiation back-scattered from the atmosphere and reflected from the earth surface in the UV and visible range 240-790 nm with a spectral resolution of 0.2-0.4 nm
AVHRR Advanced Very High Resolution Radiometer/3	Visible/infrared imaging radiometer for global measurement of cloud cover, sea surface temperature, ice, snow and vegetation cover and characteristics, six channels.
ASCAT Advanced Scatterometer	Pulsed radar in C-band at 5.2555 GHz for global sea surface wind vector measurement. ASCAT has two 500 km wide swaths with spatial resolution <50 km.
GRAS Global Navigation Satellite System Receiver for Atmospheric Sounding	Radio occultation receiver for atmosphere sounding of temperature and humidity profiles.

28 September 2012

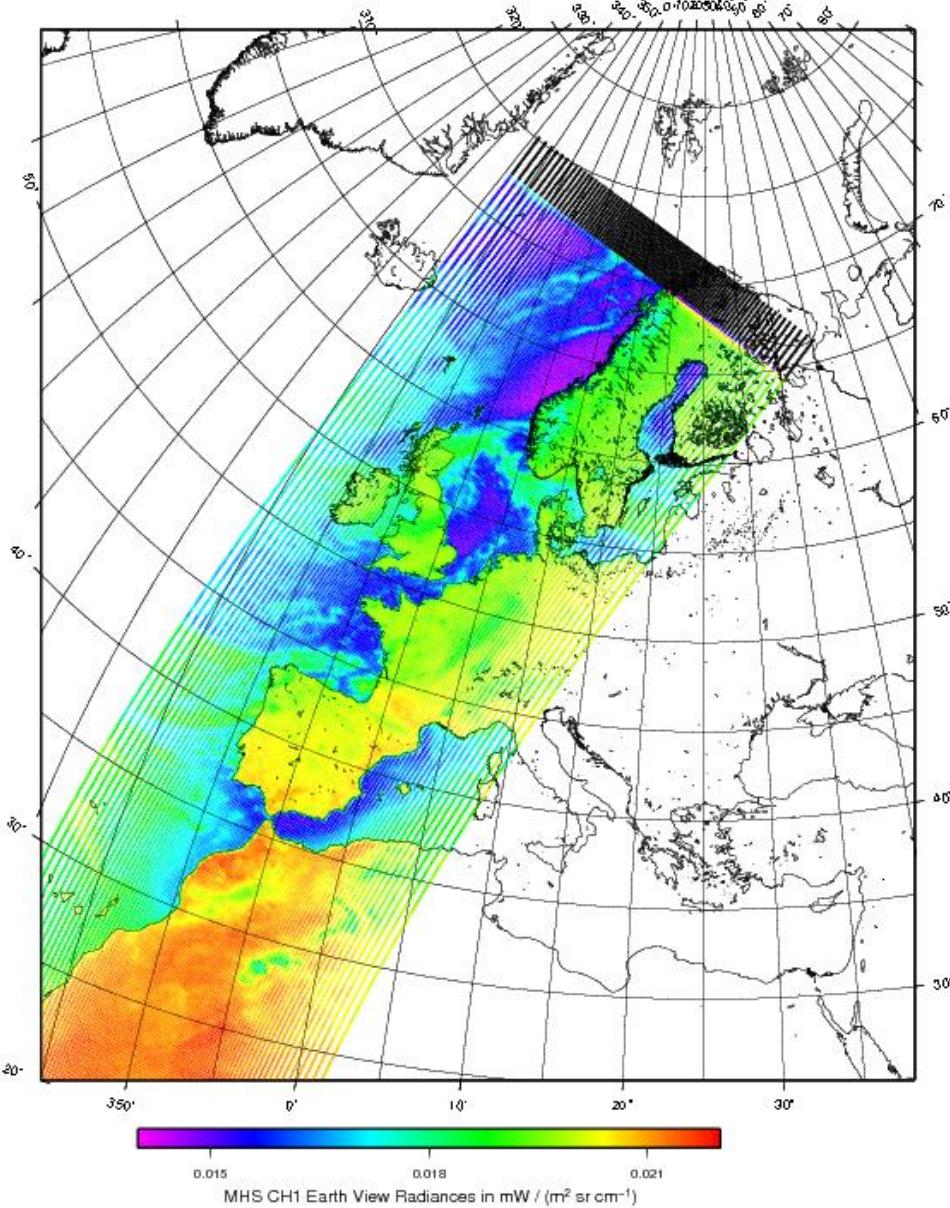

Four of the instruments on the Metop-B weather satellite (AMSU-A, ASCAT, MHS, GRAS) have been activated this week and are delivering data.

The Microwave Humidity Sounder (MHS) delivers information on atmospheric humidity in all weather conditions.

Funciona em tandem com o Metop-A

2112 km swath width and a resolution of 12 km at nadir

Metop-B MHS, Orbit 110, 25/09/12 10:06:51 to 10:24:51

Sentinel – 4 & Sentinel – 5

The instrument will be carried on the MetOp-SG A satellite.

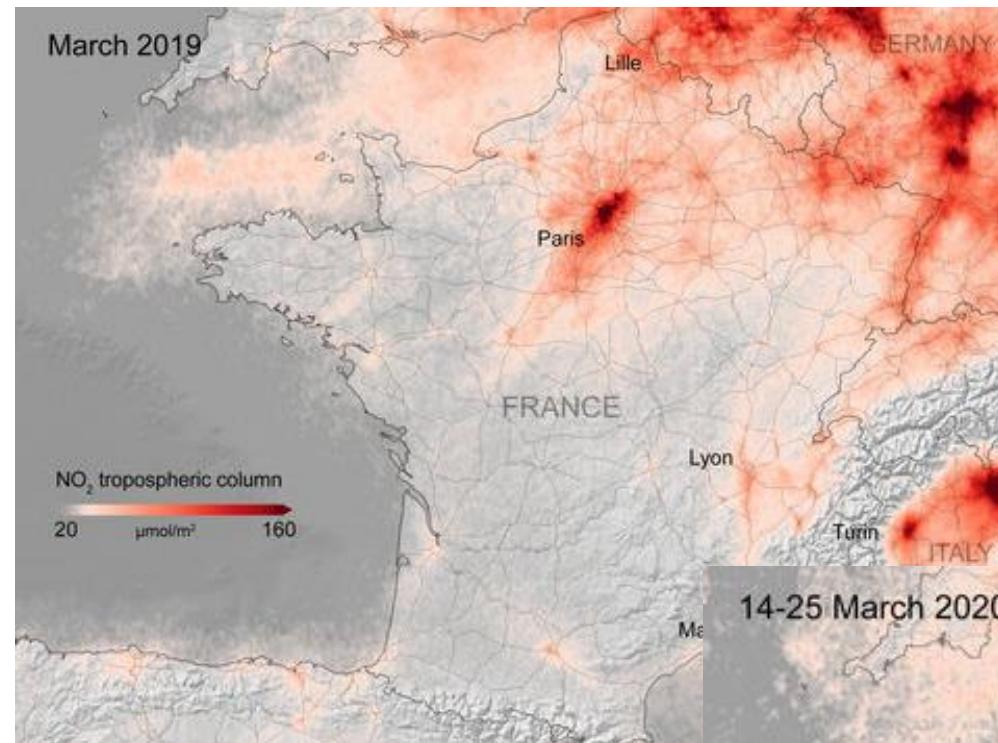

The missions SENTINEL-4, -5 and -5 precursor (S4, S5, S5P, respectively) are conceived as complementary elements of a constellation serving the specific needs of the Copernicus Atmospheric Monitoring Services (CAMS).

SENTINEL-5 is focused on air quality and composition-climate interaction with the main data products being O₃, NO₂, SO₂, HCHO, CHOCHO and aerosols.

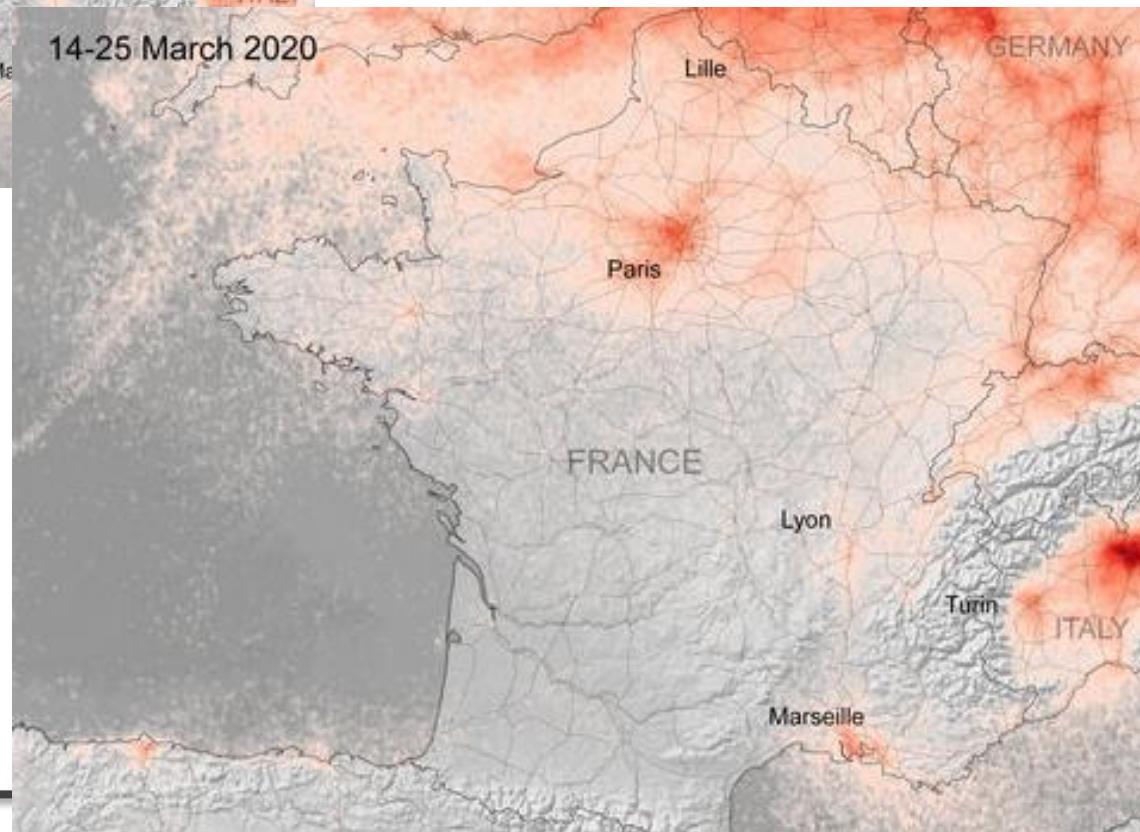

Additionally SENTINEL-5 will also deliver quality parameters for CO, CH₄, and stratospheric O₃ with daily global coverage for climate, air quality, and ozone/surface UV applications.

The SENTINEL-5 mission consists of high resolution spectrometer system operating in the ultraviolet to shortwave infrared range with 7 different spectral bands: UV-1 (270-300nm), UV-2 (300-370nm), VIS (370-500nm), NIR-1 (685-710nm), NIR-2 (745-773nm), SWIR-1 (1590-1675nm) and SWIR-3 (2305-2385nm).

Altimetria Espacial / Satellite Altimetry

Altimetria Espacial é a técnica de medir altitudes. É medido o tempo que leva um pulso radar a viajar do satélite à superfície e regressar ao satélite.

The screenshot shows the Aviso website's Altimetry page. At the top, there's a banner with the Aviso logo (a globe with blue waves) and a satellite image. Below the banner is a navigation bar with links for Novice, Expert, Sci. Teams, and language icons (UK, France, Spain). The main menu includes HOME, NEWS, APPLICATIONS, MISSIONS, ALTIMETRY (which is highlighted in blue), DORIS, NEWSSTAND, DATA, and CALVAL. On the left, a sidebar has a heading 'ALTIMETRY' with links to Principle, History, Multi-satellites, and Future improvements. The main content area features a diagram of a satellite emitting a radar pulse towards Earth. The text explains that Altimetry is a technique for measuring height using radar pulses. It also defines the 'Principle' of how altimetry works, mentioning basic principles, reflection of echoes from various surfaces, and the use of frequencies for radar altimeters.

[Home](#) / Altimetry

Altimetry

Altimetry is a technique for measuring height. Satellite altimetry measures the time taken by a radar pulse to travel from the satellite antenna to the surface and back to the satellite receiver. Combined with precise satellite location data, altimetry measurements yield sea-surface heights.

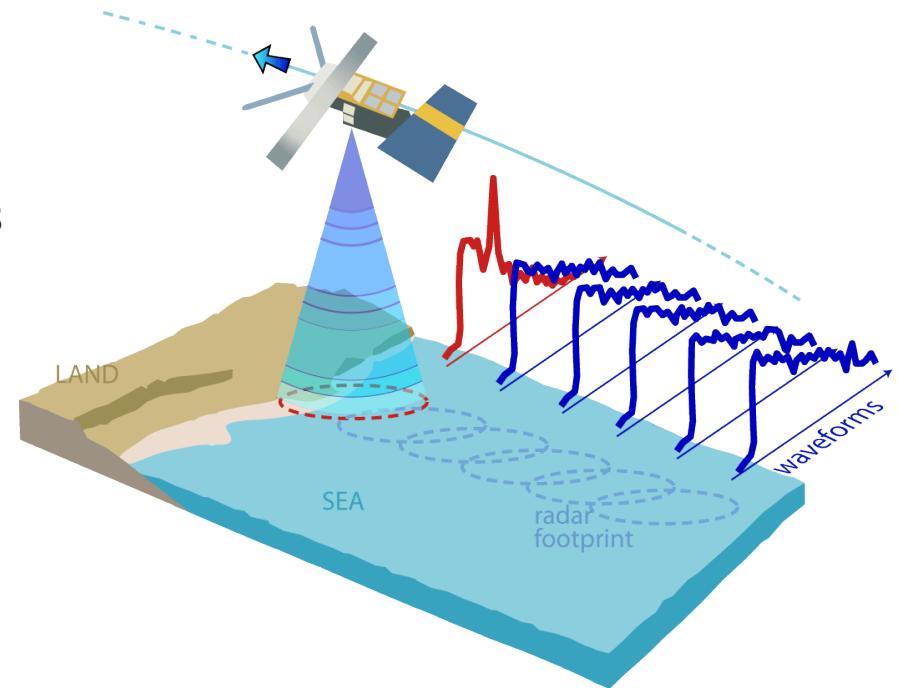

Principle

How altimetry works : basic principles, reflection of echoes on several surfaces (ocean, ice, land, river), frequencies used for radar altimeters.

Satellite Altimetry

Altimetry is a technique for measuring height. **Satellite altimetry** measures the time taken by a radar pulse to travel from the satellite antenna to the surface and back to the satellite receiver. Combined with precise satellite location data, altimetry measurements yield **sea-surface heights**.

The magnitude and shape of the echoes (or waveforms) also contain information about the characteristics of the surface which caused the reflection. The best results are obtained over the **ocean**, which is spatially homogeneous.

ESA Altimetry Missions

Sentinel-3 is primarily an **ocean mission**, however, the mission is also able to provide atmospheric and land applications. The **Sentinel-3** mission continues the monitoring of the sea state, wind speed, sea-ice and ice thickness as started by the ERS-1 (1991), ERS-2 (1995), Envisat (2002) and CryoSat (2010) missions.

The Sentinel-3 mission's main objective is to measure **sea-surface topography**, sea-and land-surface **temperature** and ocean- and **land-surface colour** with high-end accuracy and reliability in support of **ocean forecasting systems**, and for **environmental** and **climate monitoring**.

Sentinel -3

SENTINEL-3 is an European Earth Observation satellite mission developed to support

GMES ocean, land, atmospheric, emergency, security and cryospheric applications.

The SENTINEL-3 mission is jointly operated by ESA and EUMETSAT to deliver operational ocean and land observation services.

The spacecraft carries four main instruments:

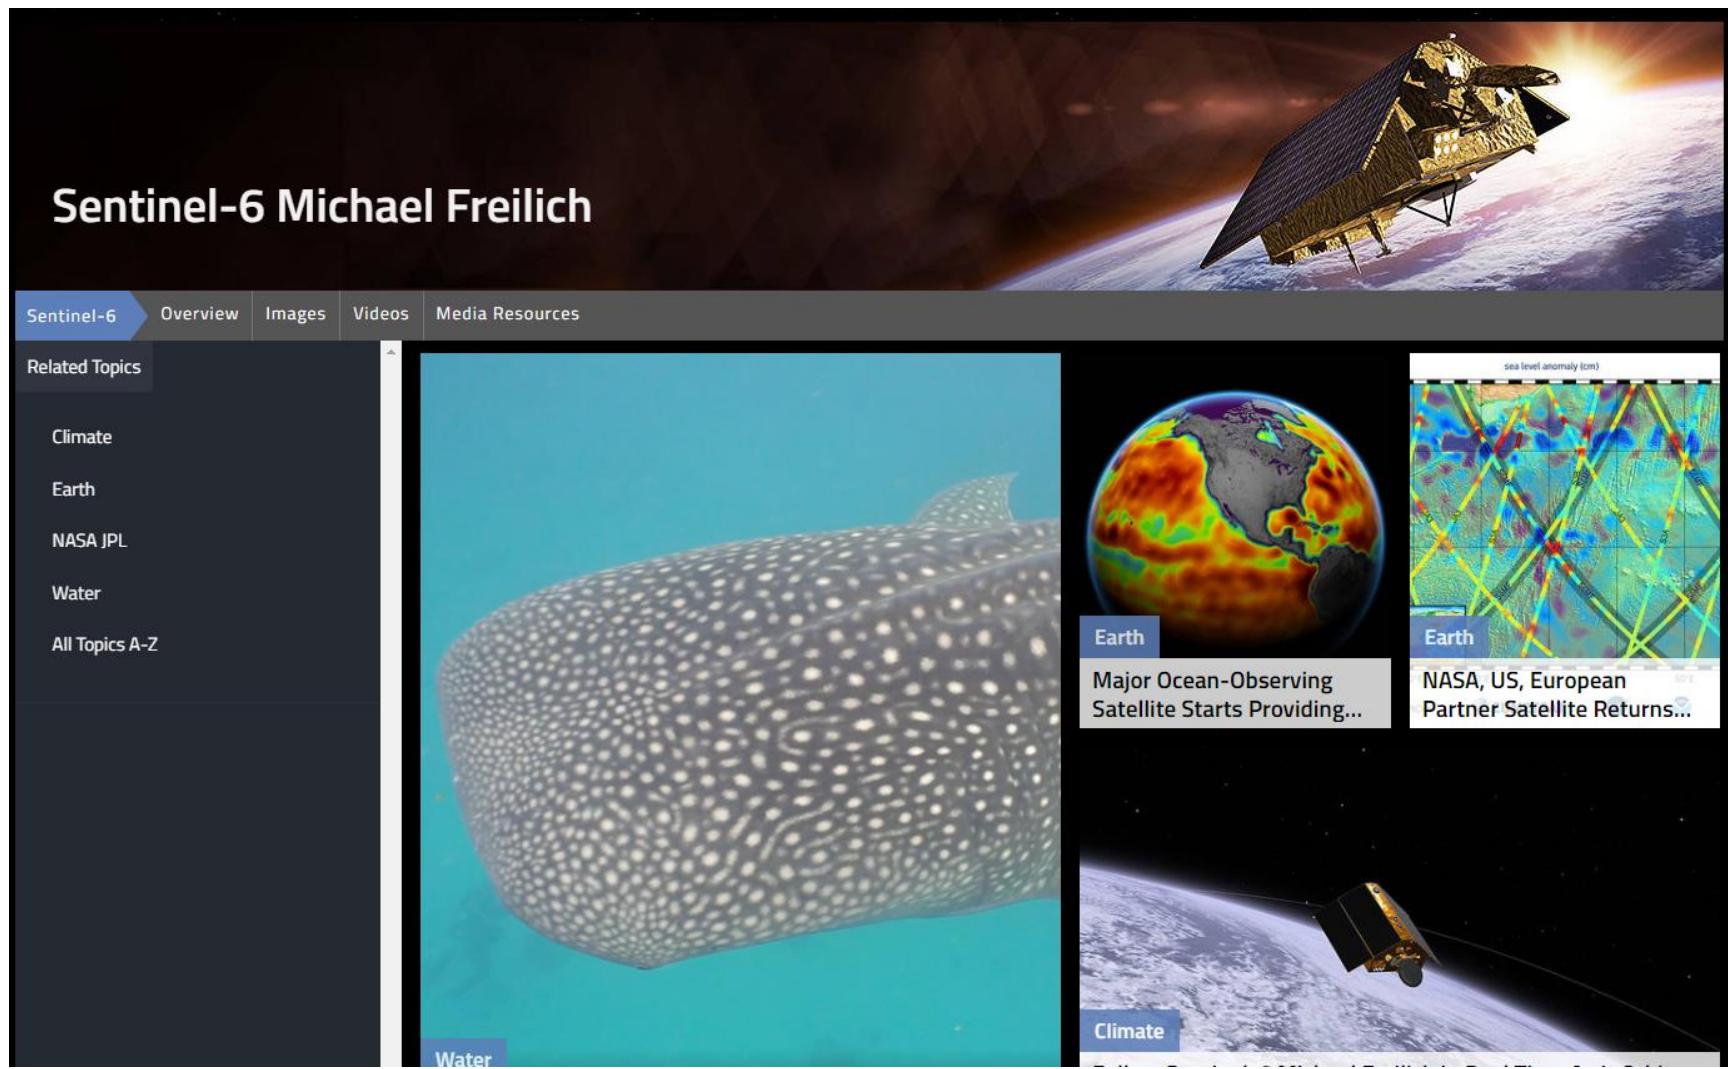

OLCI: Ocean and Land Colour Instrument

SLSTR: Sea and Land Surface Temperature Instrument

SRAL: SAR Radar Altimeter

MWR: Microwave Radiometer.

Fig. 2. Geoid height differences between each 2003 monthly gravity solution and the 14-month mean for equatorial South America (smoothing radius: 400 km; degree-2 coefficients not included). This level of smoothing admits more error from the GRACE estimates, but the large signal in this region allows a higher resolution. Spacecraft events resulted in insufficient ground coverage to resolve the gravity field for the months of January and June.

Continuity of ice sheet mass loss in Greenland and Antarctica from the GRACE and GRACE Follow-On missions.

Isabella Velicogna et al., GRL, April 2020

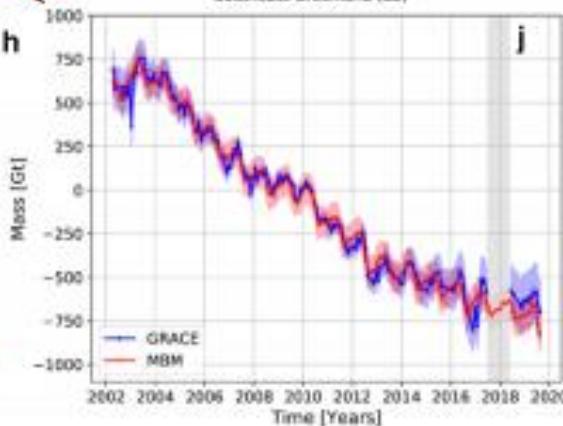

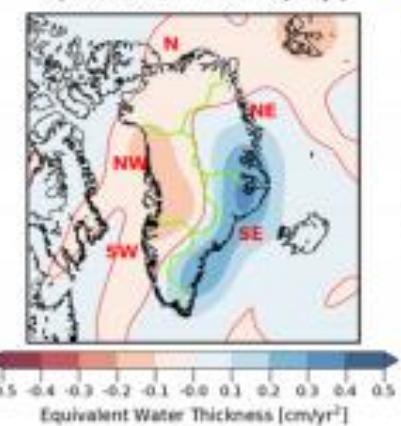

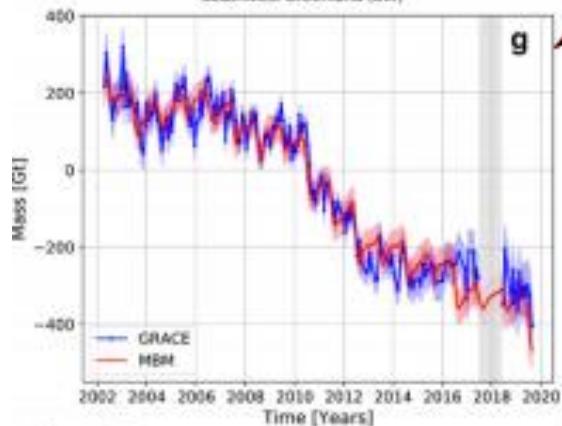

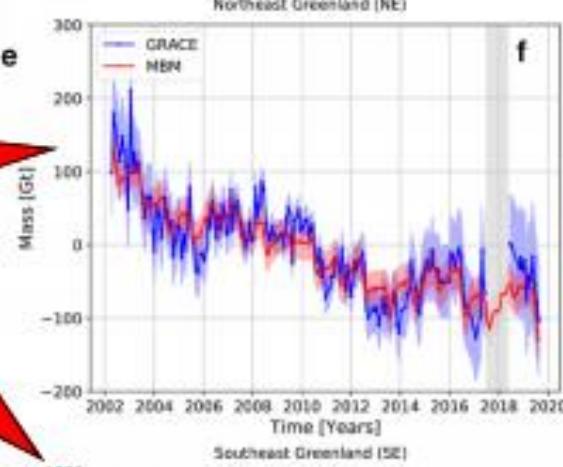

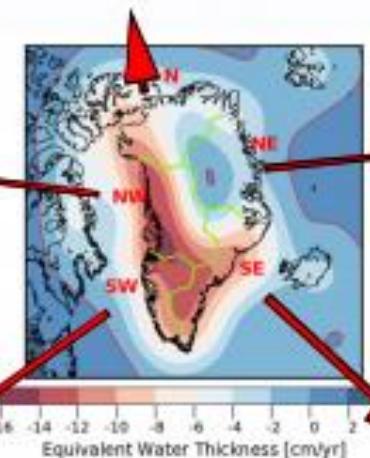

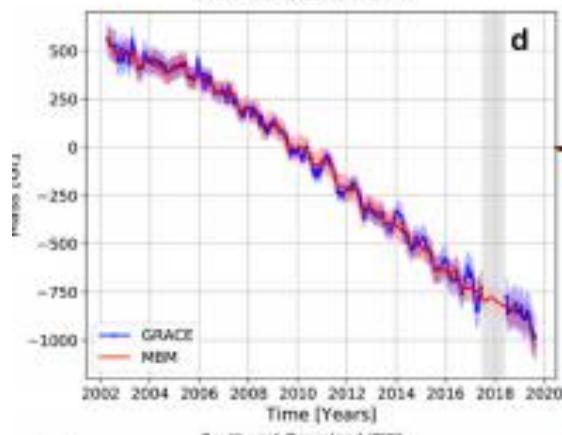

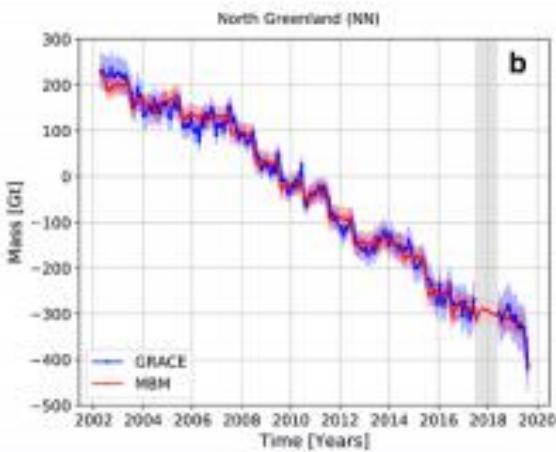

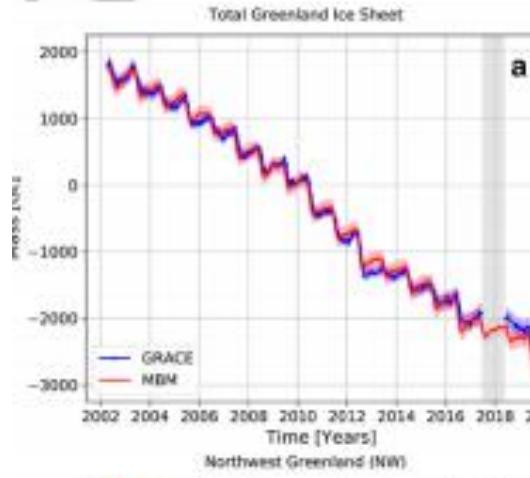

Abstract

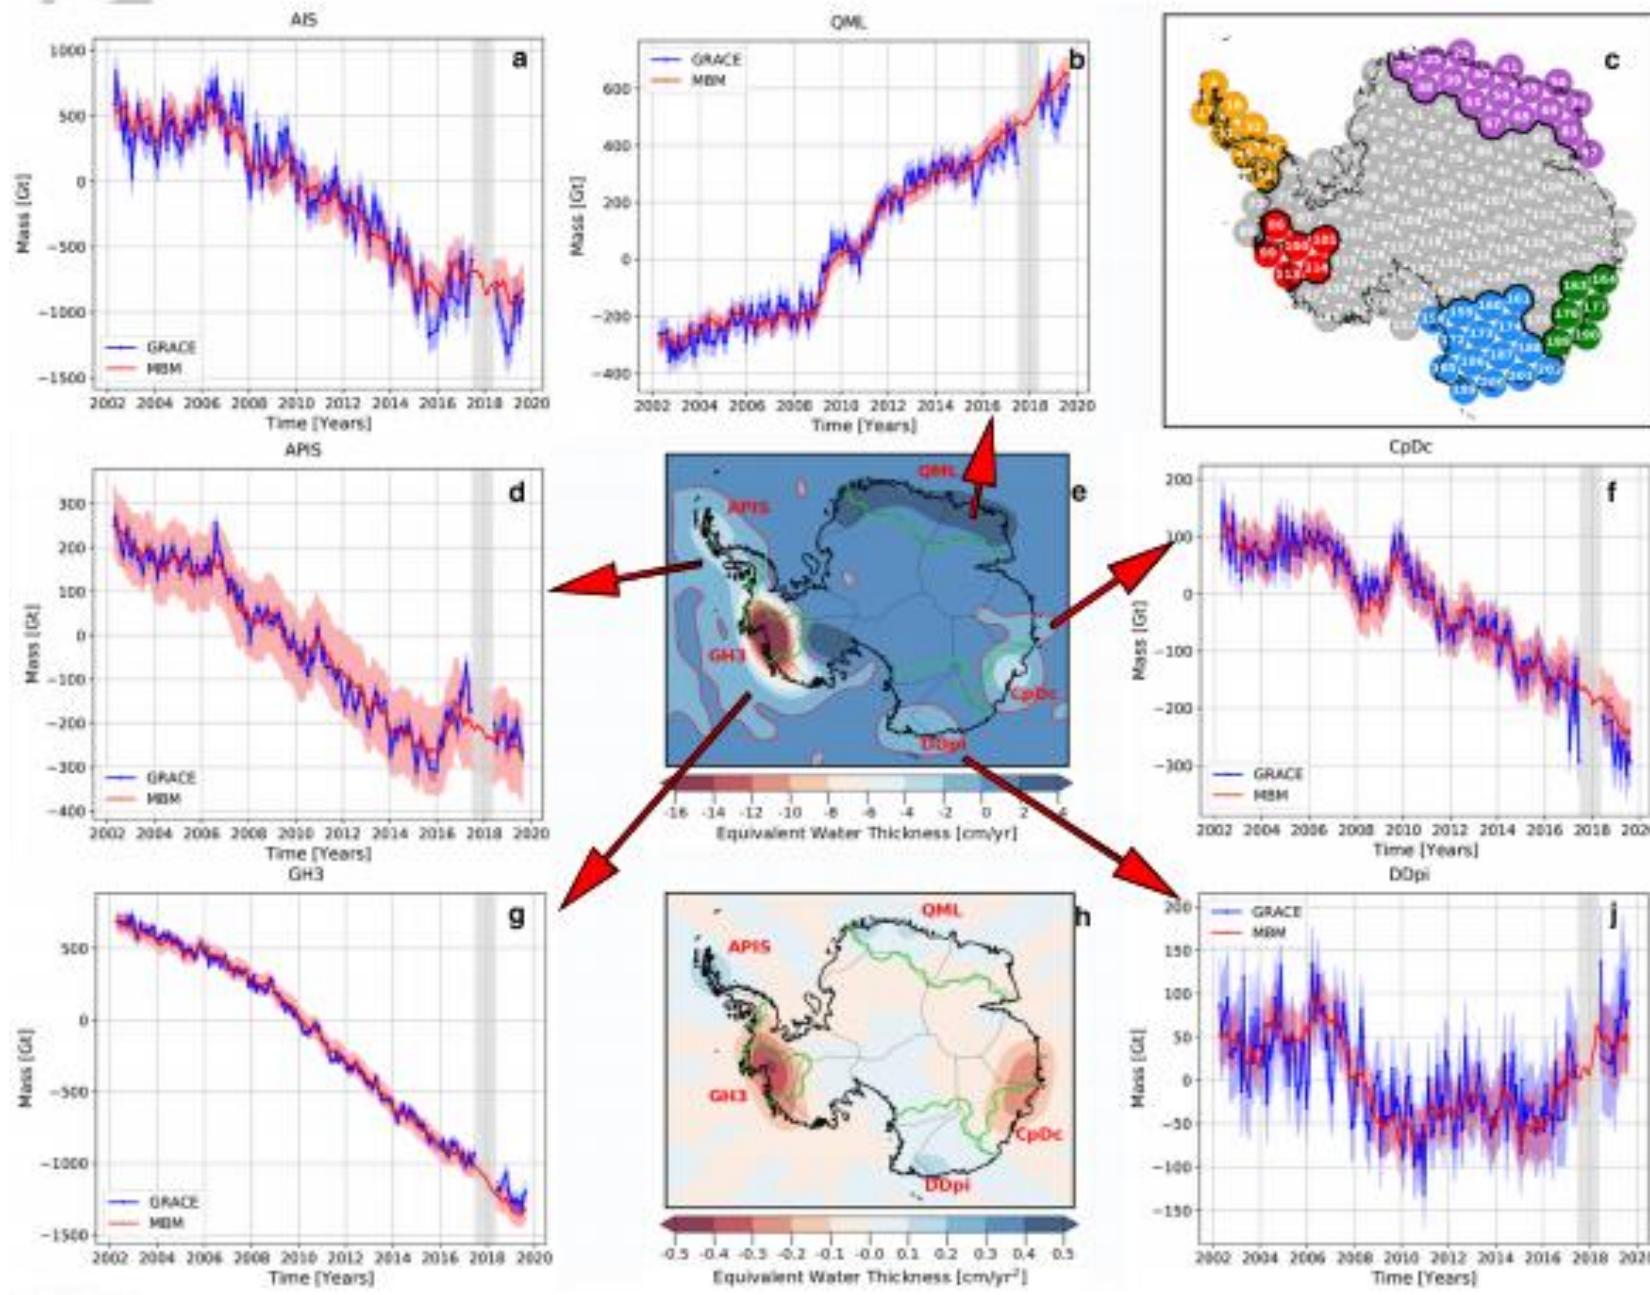

In Greenland, the GRACE-FO data reveal an exceptional summer loss of 600 Gigatonnes in 2019 following two cold summers.

In Antarctica, ongoing high mass losses

in the Amundsen Sea Embayment of West Antarctica,
the Antarctic Peninsula, and
Wilkes Land in East Antarctica
cumulate to 2130, 560, and 370 Gigatonnes, respectively, since 2002.

A cumulative mass gain of 980 Gigatonnes in Queen Maud Land since 2009, however, led to a pause in the acceleration in mass loss from Antarctica after 2016.

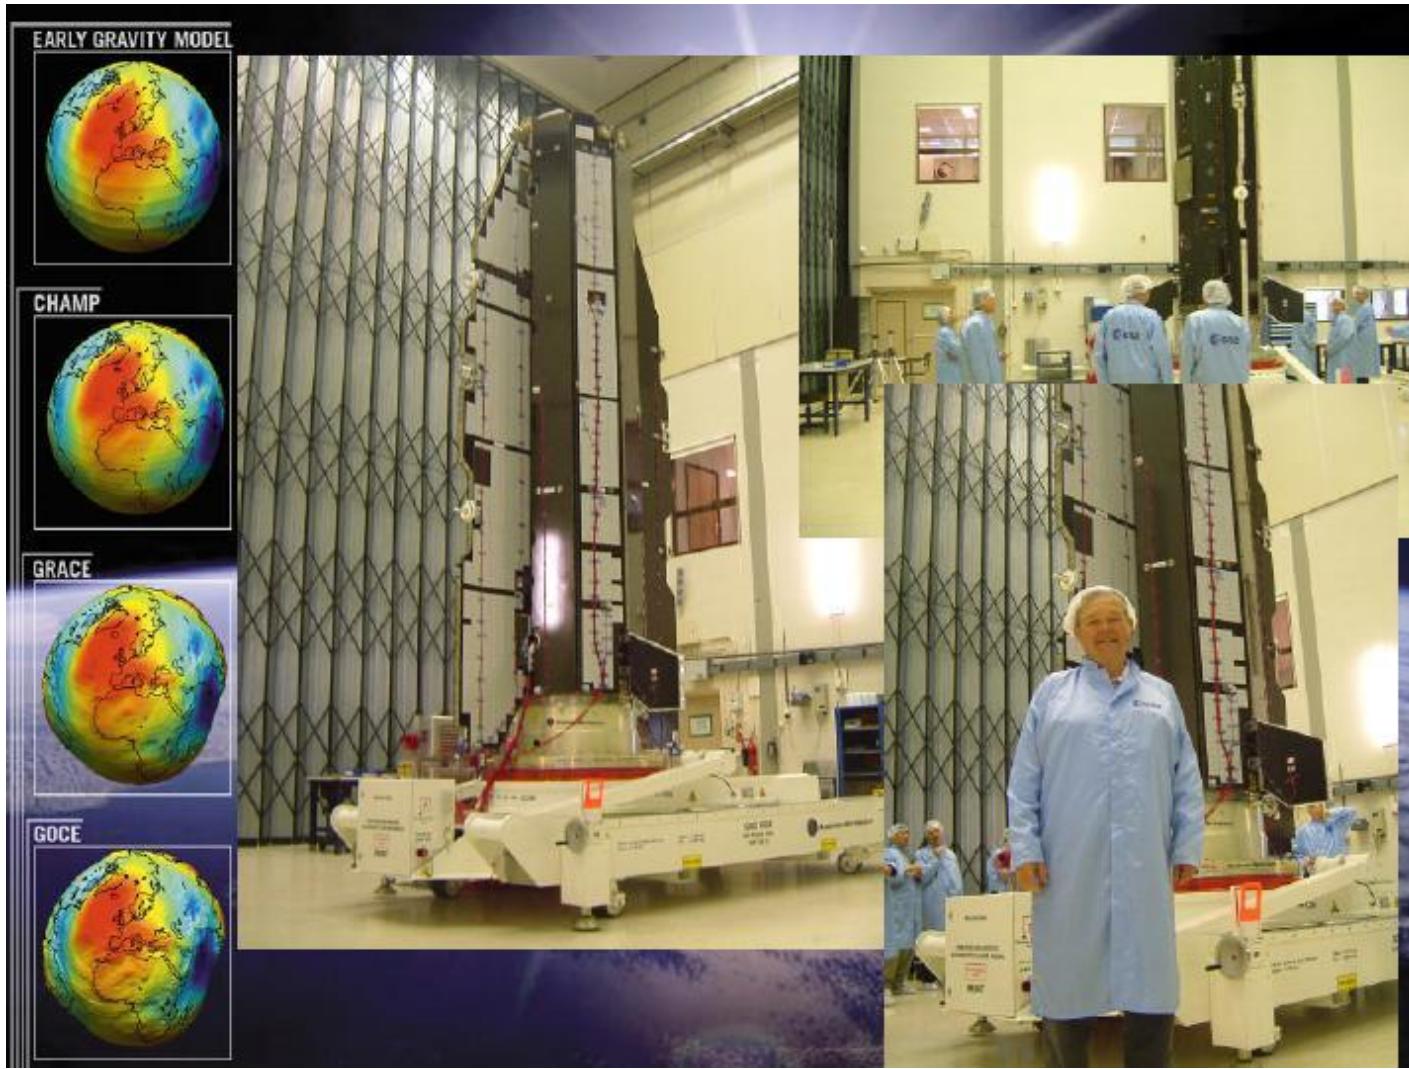

Gravity Field Missions

The three missions are based on different space segments which have in common their extremely **low and (almost) polar orbit**, continuous and three-dimensional tracking by **GPS** and their ability to separate non-gravitational from gravitational signal parts.

GOCE's main objective is to measure the geoid with an **accuracy of about 1 cm, gravity anomalies of 1mGal** and a **spatial half-wavelength resolution of about 70 km** (determine the static Earth gravity field down to features of 100 km-70 km - half wavelength - in terms of spatial resolution).

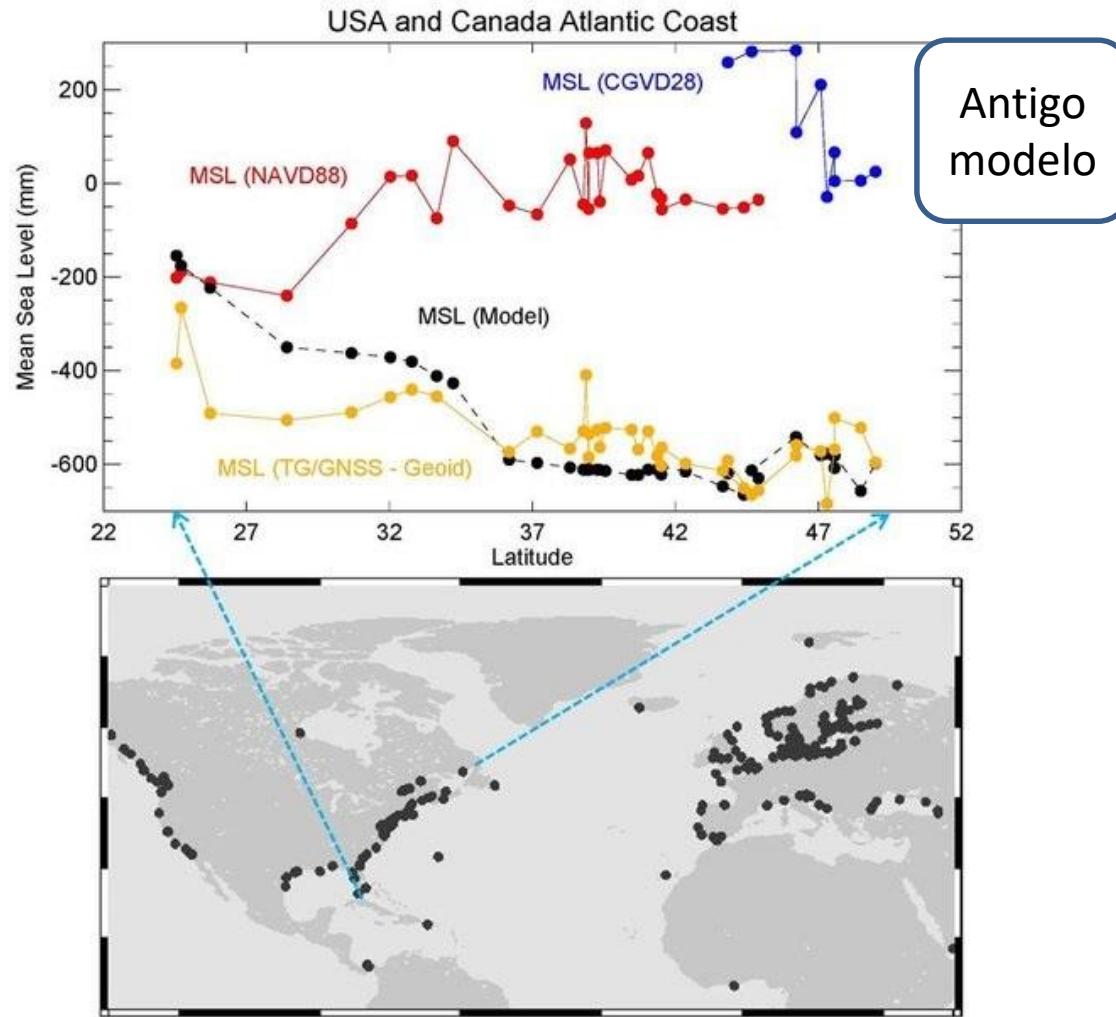

GOCE

Mean Sea Level

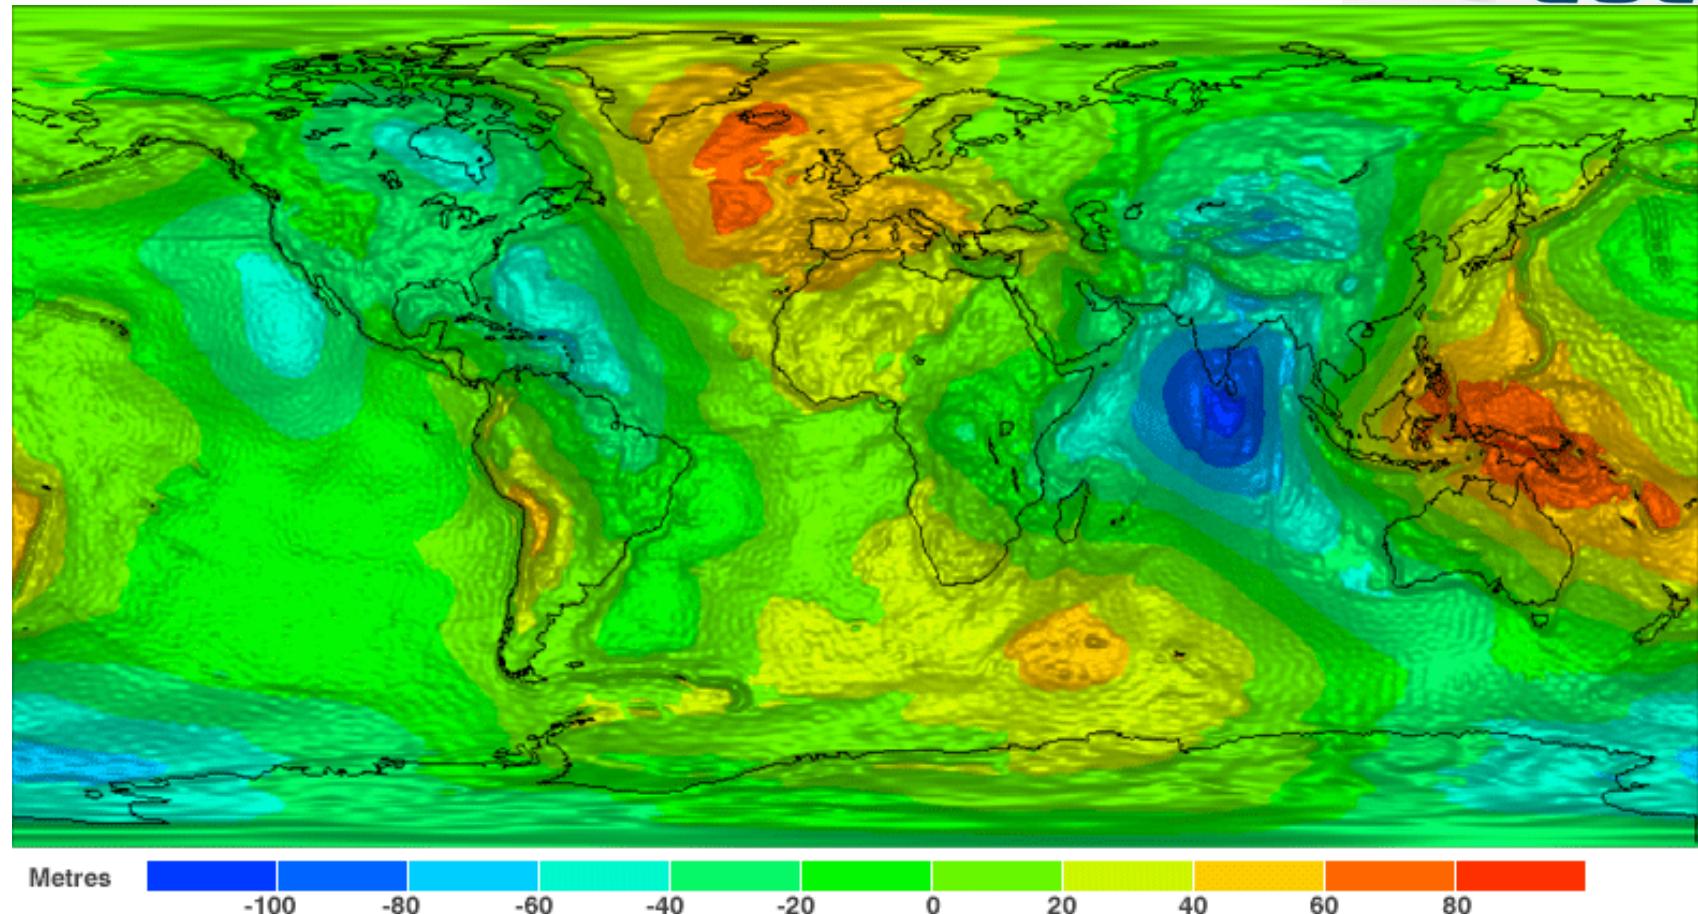

Philip Woodworth from the National Oceanography Centre Liverpool said, “GOCE has resolved this old debate in the oceanographers’ favour.

“The results prove conclusively **that sea level decreases** going north along the North American Atlantic coastline, in agreement with the ocean models.”

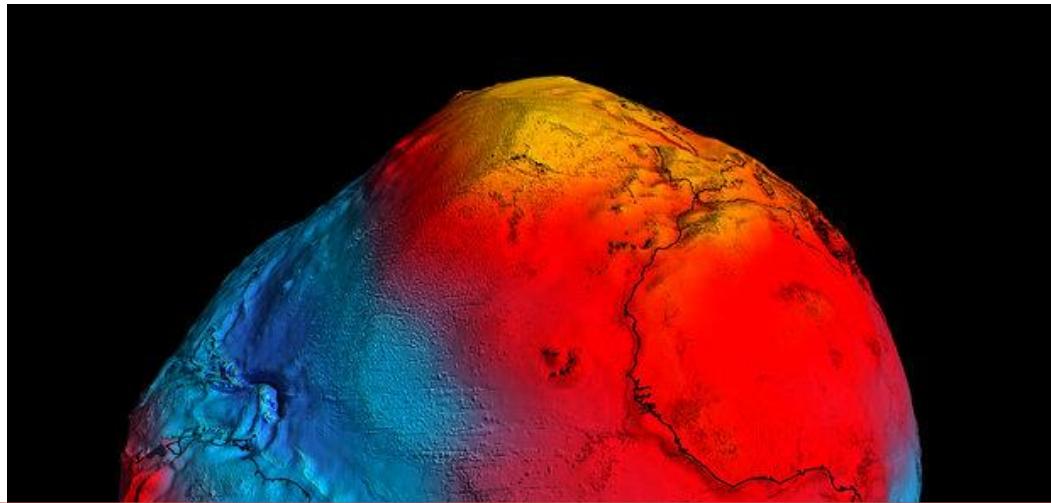

Fev. 2103

Gravity Field Missions

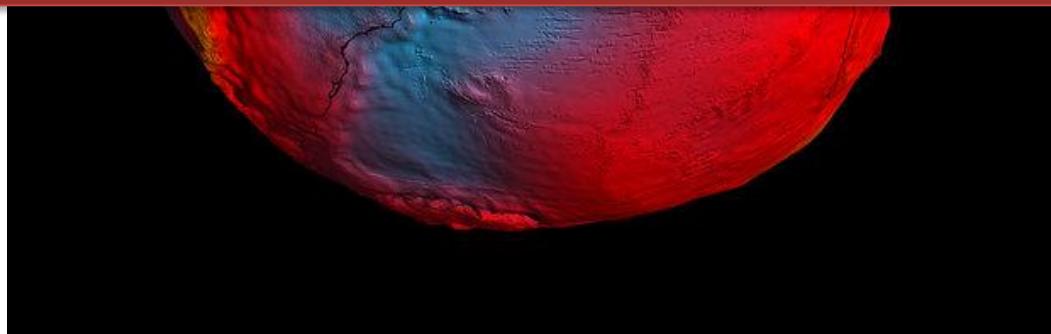

Global gravity model based on GOCE satellite data

GOCE - Geoid Model

Importantly, data from GOCE will lead to a unified global height system so that we can consistently study sea-level change apparent in tide gauge and satellite altimetry data." Rummel, Fev 2013

2013

Earth Observation Satellites

Landsat Missions: Imaging the Earth Since 1972

Earth Resources Technology Satellite (ERTS-1), later renamed **Landsat-1**, was launched on July 23, 1972.

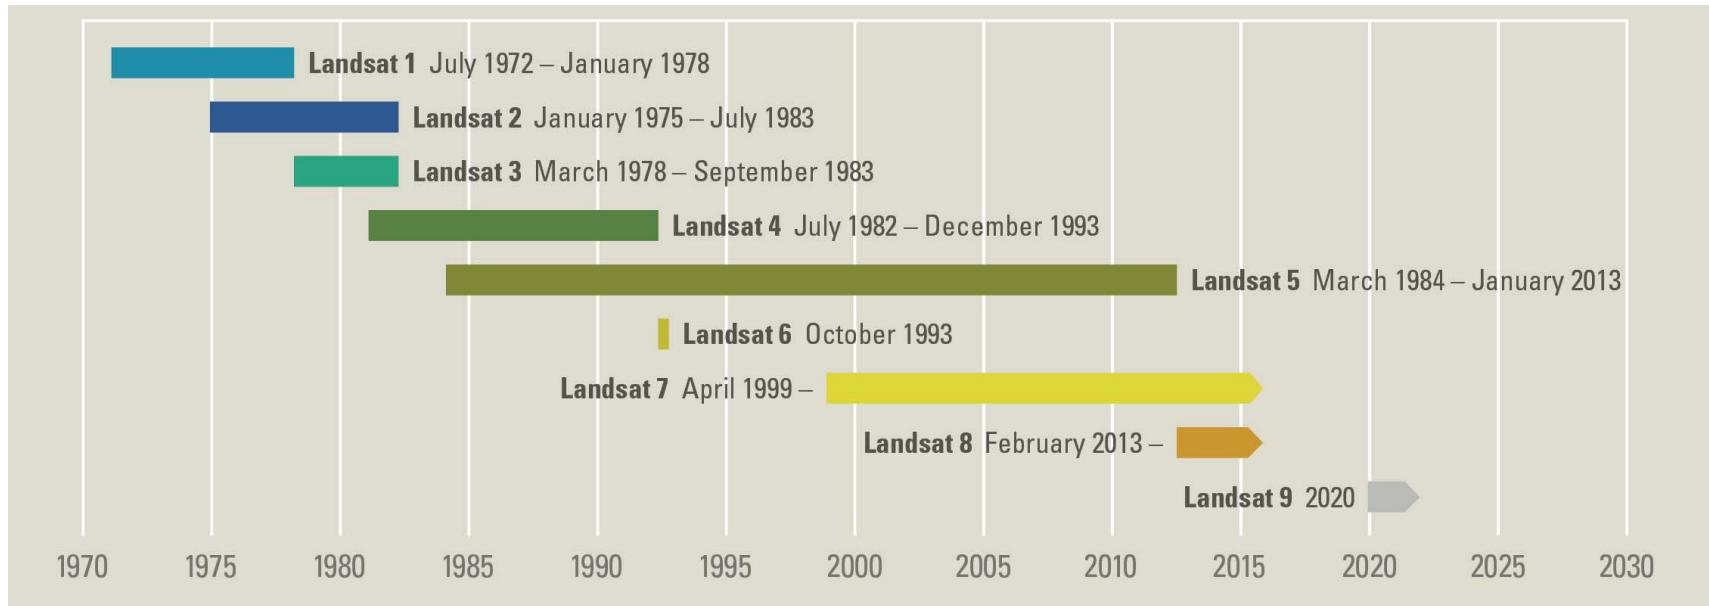

The launches of **Landsat-2**, **Landsat-3**, and **Landsat-4** followed in 1975, 1978, and 1982, respectively.

Earth Observation Satellites

Landsat-5, launched in 1984, lasting 28 years and 10 months, officially setting a new Guinness World Record for "longest-operating Earth observation satellite."

Landsat-7 successfully launched in 1999 and, along with **Landsat-8**, launched in 2013, continues to provide daily global data. **Landsat-9** was launched in September 2021 (8 days revisit time).

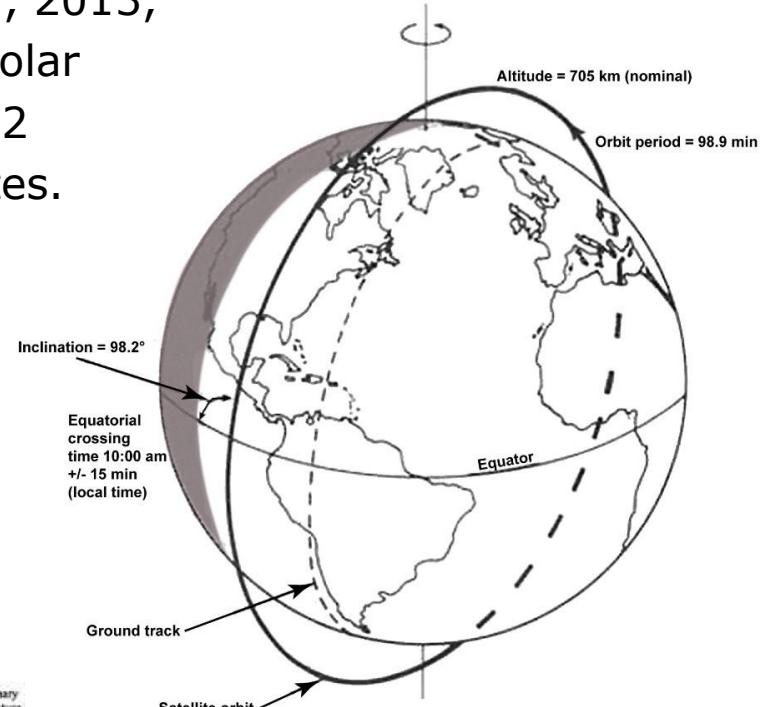

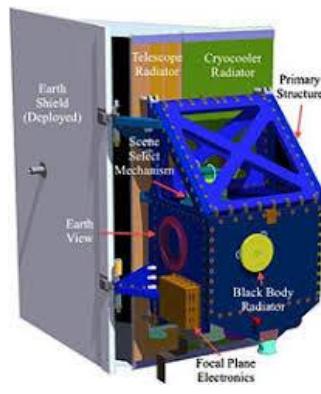

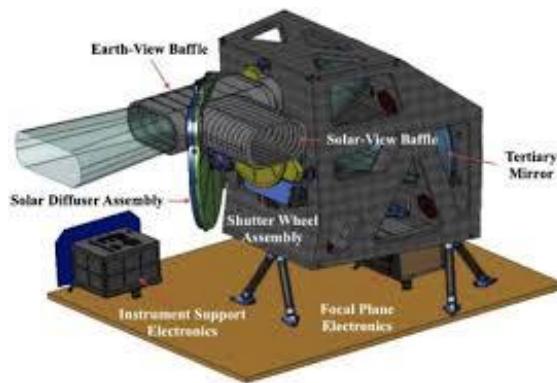

Earth Observation Satellites

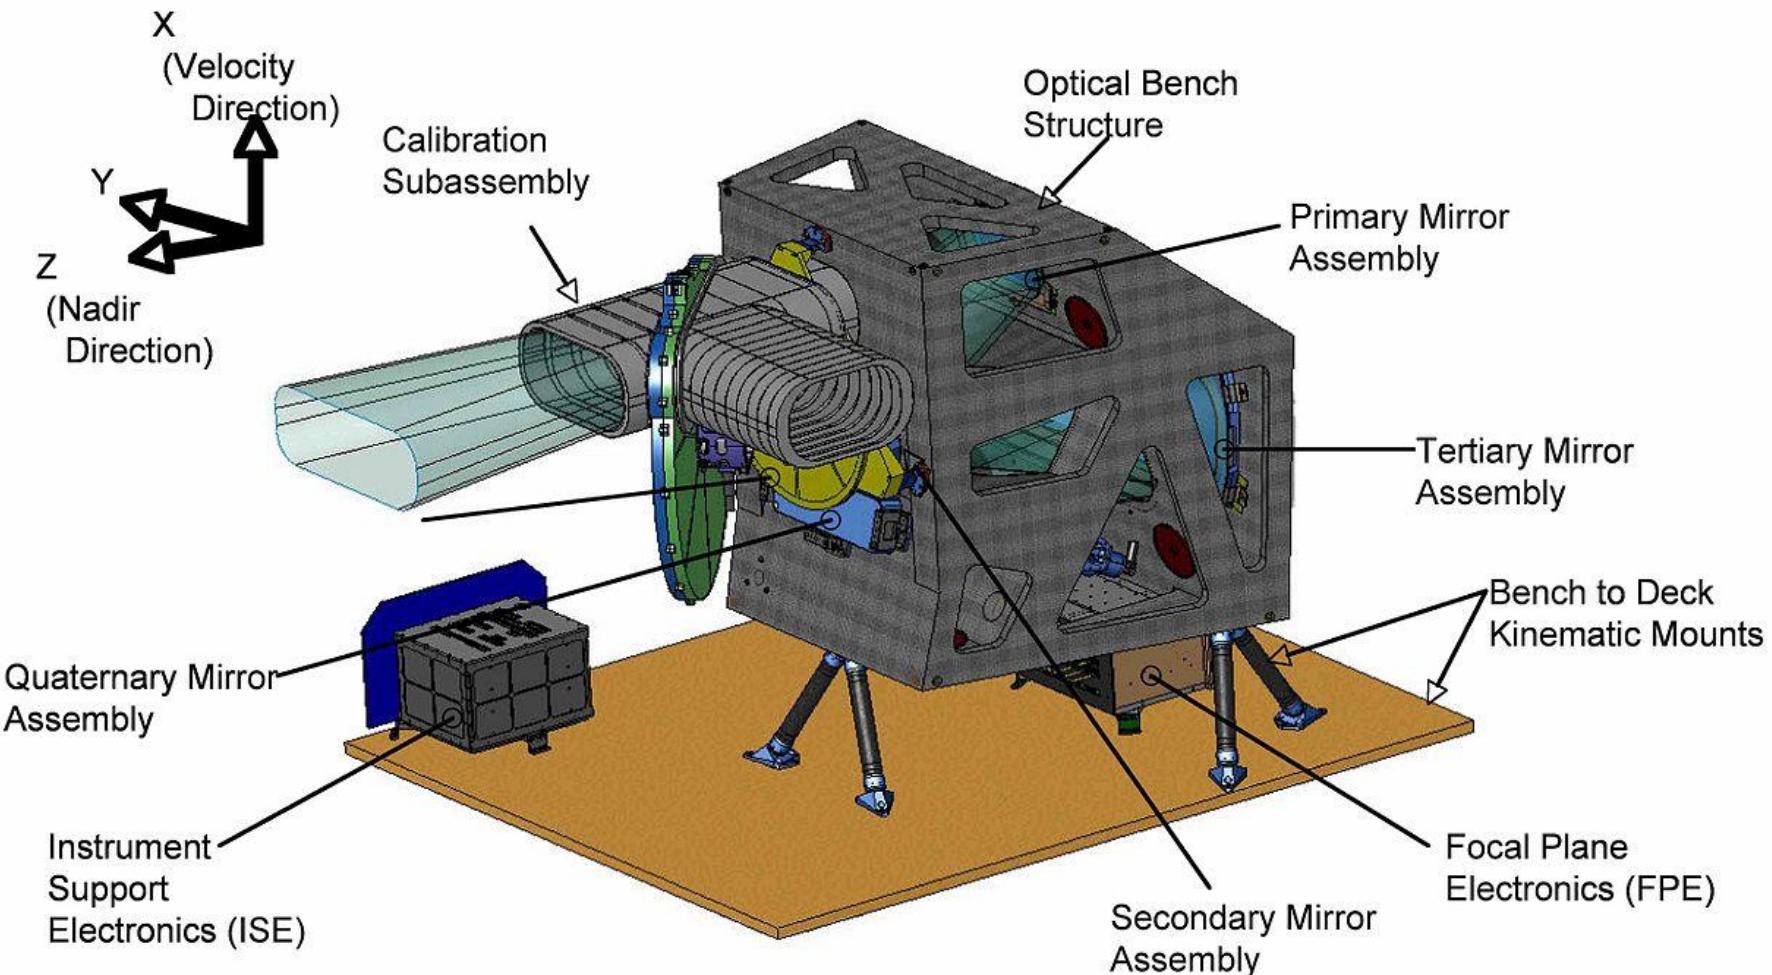

Landsat-8 satellite, launched on February 11, 2013, orbits the Earth in a sun-synchronous, near-polar orbit, at an altitude of 705 km, inclined at 98.2 degrees, and circles the Earth every 99 minutes.

Landsat-8 carries two pushbroom instruments: the **Operational Land Imager (OLI)** and the **Thermal Infrared Sensor (TIRS)**.

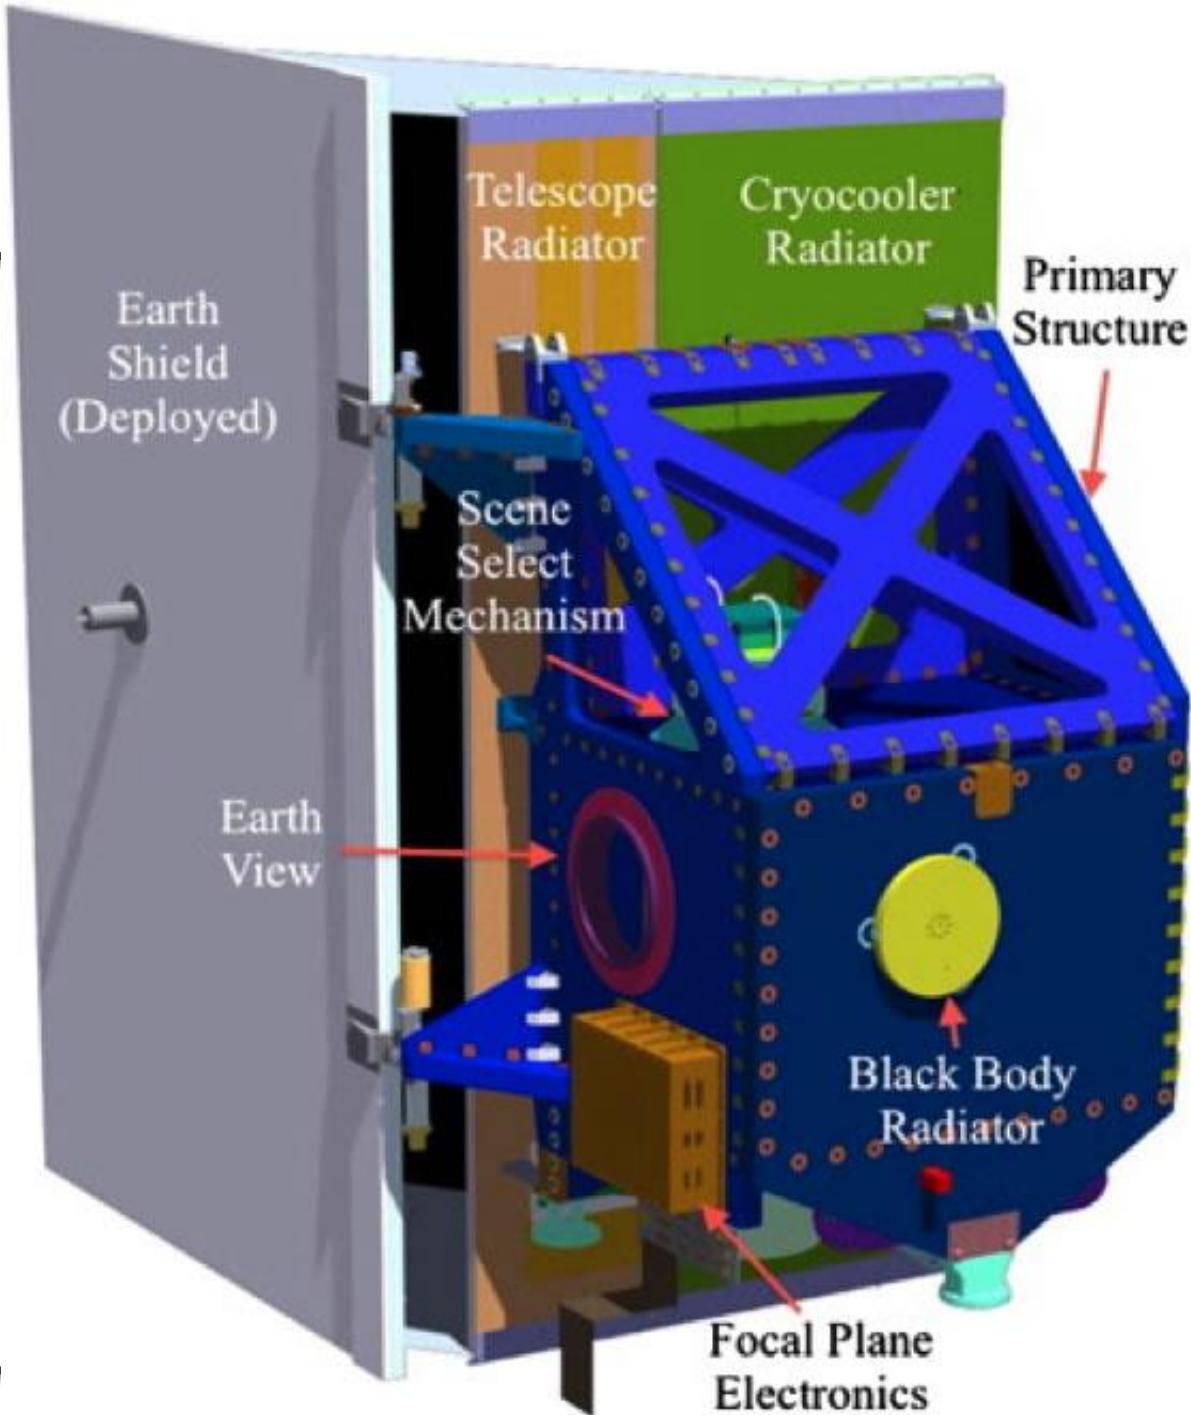

OLI Instrument Overview

15-degree field-of-view, 7000 pixels per spectral band, exception of the 15 m panchromatic band that requires over 13,000 detectors (<http://landsat.gsfc.nasa.gov/?p=5775>)

Thermal InfraRed Sensor (TIRS)

Earth Observation Satellites

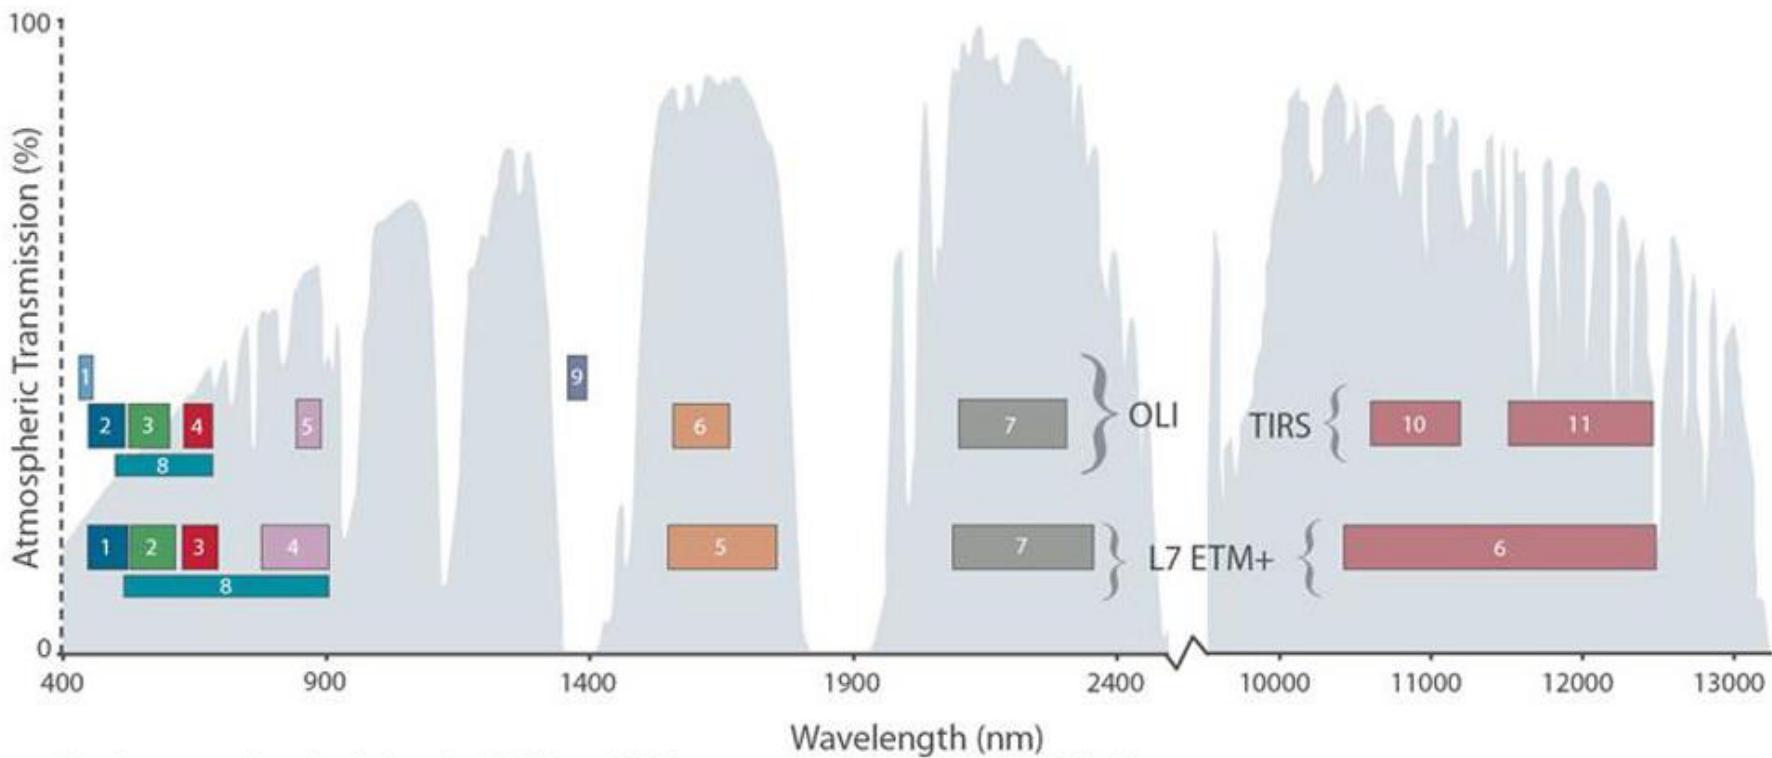

Spectral Resolution	11 spectral bands OLI - 9 spectral bands, including a panchromatic band TIRS - 2 spectral bands
Spatial Resolution	15 m - 1 OLI panchromatic band 30 m - 8 OLI bands 100 m - 2 TIRS spectral bands
Radiometric Resolution	12-bits (16-bits when processed into Level-1 data products)
Temporal Resolution	16-day repeat cycle
Swath Width/ Scene Size	170 km x 185 km (106 mi x 115 mi) (7000*30m=210km)

Earth Observation Satellites

The **USGS Earth Explorer** is a quick and easy way to download free Landsat imagery and other remote sensing data.

<https://earthexplorer.usgs.gov/>

Images are delivered as .tar.gz compressed files (approximately 1 GB) which are unzipped as GeoTIFF files (approximately 2 GB).

The screenshot shows the USGS Earth Explorer interface. The top navigation bar includes links for Home, Save Criteria, Load Favorite, Manage Criteria, and a user account section. The main content area is titled "Search Results" and displays a map of Europe with a red dot indicating a specific location. Below the map, two data sets are listed:

- 1. ID:L008_L1TP_204033_20190301_20190301_01_RT**
Acquisition Date:01-MAR-19
Path:204
Row:33
- 2. ID:L008_L1TP_204033_20190213_20190222_01_T1**
Acquisition Date:13-FEB-19
Path:204
Row:33

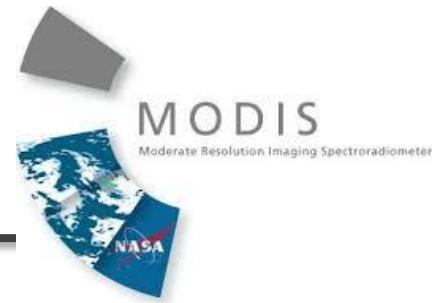

Each item has a thumbnail preview, download links, and a delete icon. Navigation controls at the bottom allow for first, previous, next, and last page links.

Earth Observation Satellites

Landsat-8 (13.02.2019)

Earth Observation Satellites

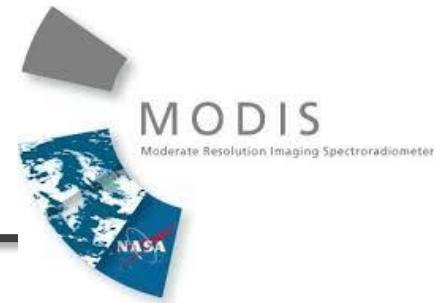

MODIS (or Moderate Resolution Imaging Spectroradiometer) is a key instrument aboard the **Terra** (December 1999, originally known as EOS AM) and **Aqua** (May, 2002, originally known as EOS PM) satellites.

Terra's orbit around the Earth is timed so that it passes from north to south across the equator in the morning (10:30 am), while **Aqua** passes south to north over the equator in the afternoon (01:30 pm).

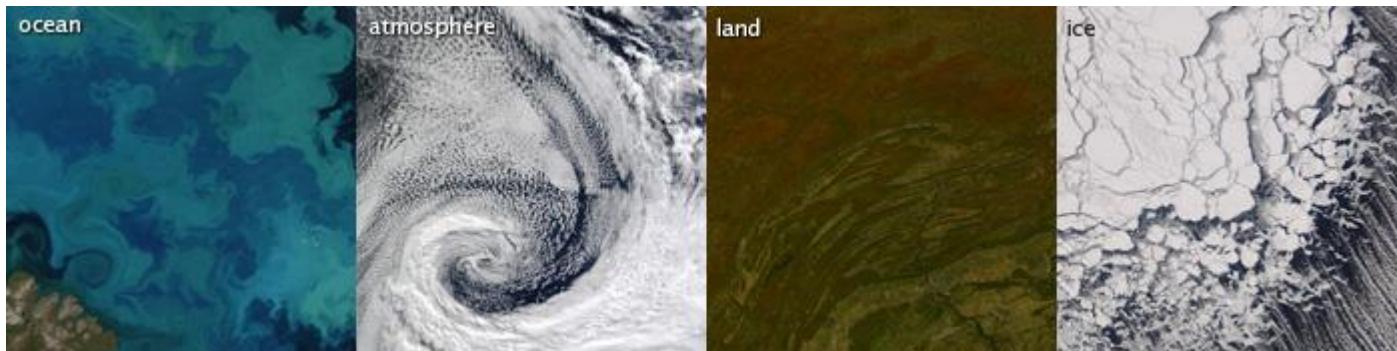

Earth Observation Satellites

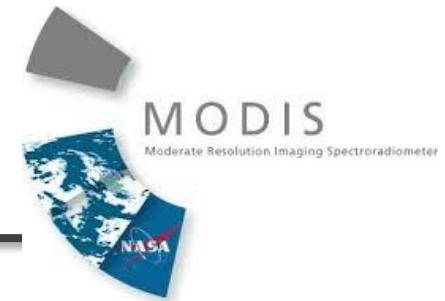

The MODIS instrument, operating both the Terra and Aqua spacecraft, has a viewing **swath width of 2,330 km** and views the entire surface of the Earth every 1 to 2 days, acquiring data in **36 spectral bands** between 0.4 and 14.4 μm , at three spatial resolutions - 250m, 500m, and 1,000m.

The many **data products** derived from MODIS observations describe features of the **land**, **oceans** and the **atmosphere** that can be used for studies of processes and trends on local to global scales.

SPOT (Système Pour l'Observation de la Terre)

The SPOT Constellation

The system has been operational since 1986 when **SPOT-1** was launched. SPOT-2 was placed in orbit in January 1990, followed by SPOT-3 in September 1993, SPOT-4 in March 1998 and SPOT-5 in May 2002. System continuity is assured by the **SPOT-6** and **SPOT-7** constellation.

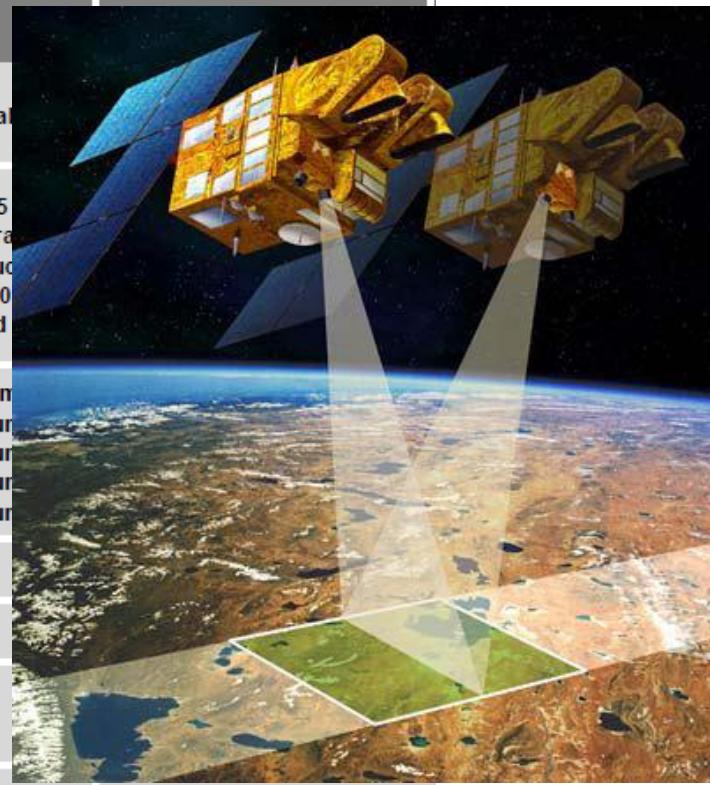

SPOT – Eletromagnetic Spectrum

ESA Missions

ERS mission (European Remote Sensing)

ERS mission overview

- 15 years of ERS-1/2 data in the archive
 - (suitable for applications requiring long term series products)
- ERS-2 achieved 11 years in orbit in April 2006
 - (was designed for 3 years nominal lifetime)
- Some problems with the platform
 - (gyroscope in 2001, tape recorder in 2003)
 - but all instruments still functioning well
 - engineering solutions have been developed:
 - new 'gyro-less' working mode
 - set up of a station network for Low Bit Rate data recovery
- Operations funding until 2008

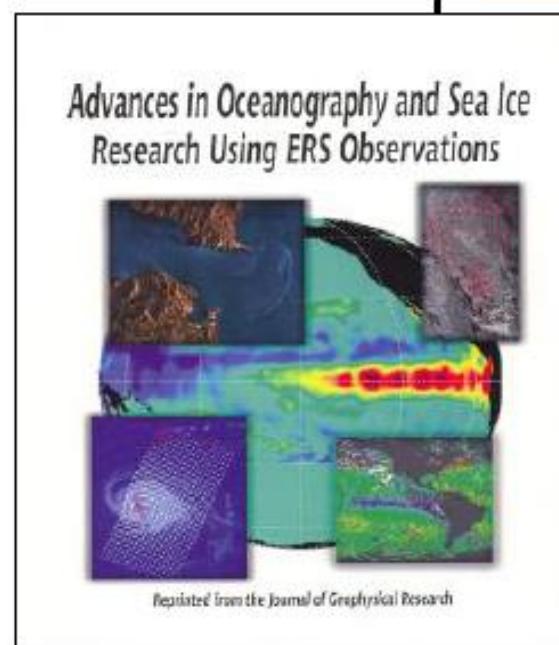

ENVISAT Mission

- Largest European satellite & largest worldwide EO satellite:
 - unique combination of 10 instruments addressing land, ocean, ice and atmosphere studies,
 - instruments working nominally, except MIPAS instrument
 - Satellite OK with long-term operations capabilities:
 - 65 % of fuel available (about 5 years)
 - 78 different types of data products
 - but many more geophysical parameters
 - 250 Gigabytes of data products generated per day
 - Nominal lifetime (5 years) ends in March 2007
 - but operations funding until end 2010
-

- **Sentinel 5 – Low-orbit atmospheric**
 - Atmospheric composition monitoring

Sentinel -1

The Sentinel-1 mission is designed as a two-satellite constellation. The identical satellites orbit Earth 180° apart and at an altitude of almost 700 km. This configuration optimises coverage, offering a global revisit time of just six days.

At the equator, however, the repeat frequency is just three days and less than one day over the Arctic. Europe, Canada and main shipping routes are covered in less than three days.

Sentinel-2 Mission

Sentinel-2 mission comprises a constellation of two polar-orbiting satellites placed in the same sun-synchronous orbit, phased at 180° to each other.

It aims at monitoring variability in land surface conditions, and its wide swath width (290 km) and high revisit time (10 days at the equator with one satellite, and 5 days with 2 satellites under cloud-free conditions which results in 2-3 days at mid-latitudes) will support monitoring of Earth's surface changes.

The coverage limits are from between latitudes 56° south and 84° north.

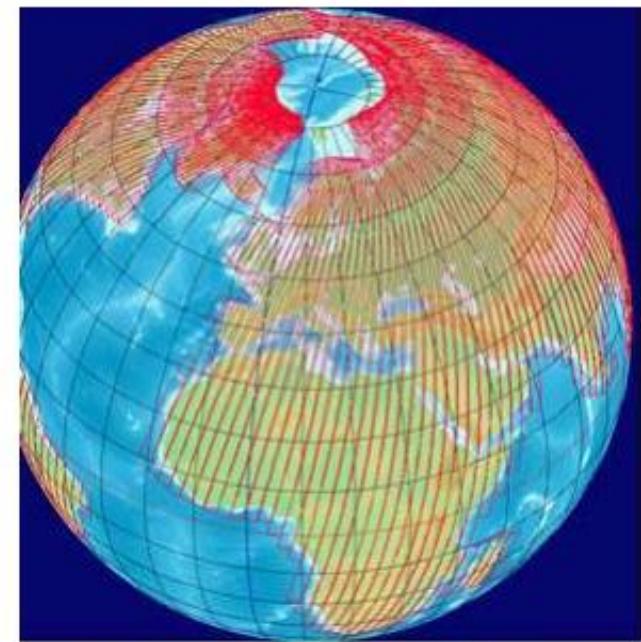

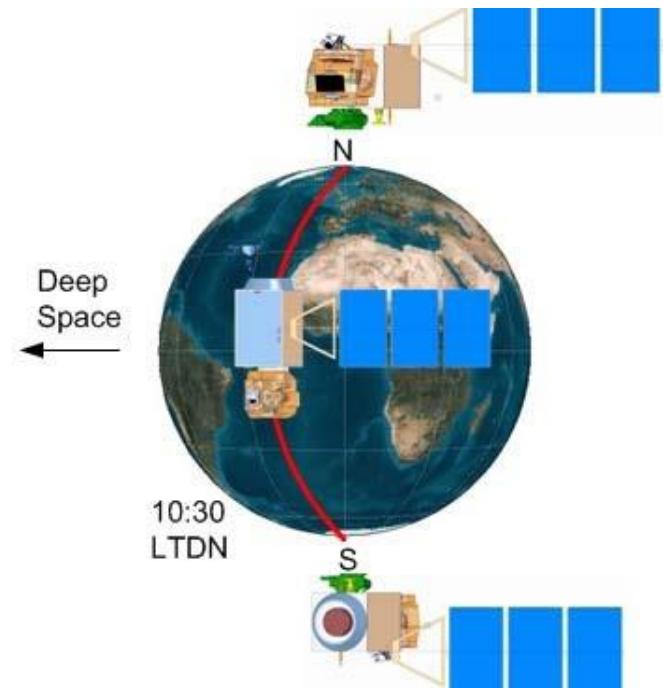

Figure 22: Modelled Sentinel-2 Coverage

Sentinel -2

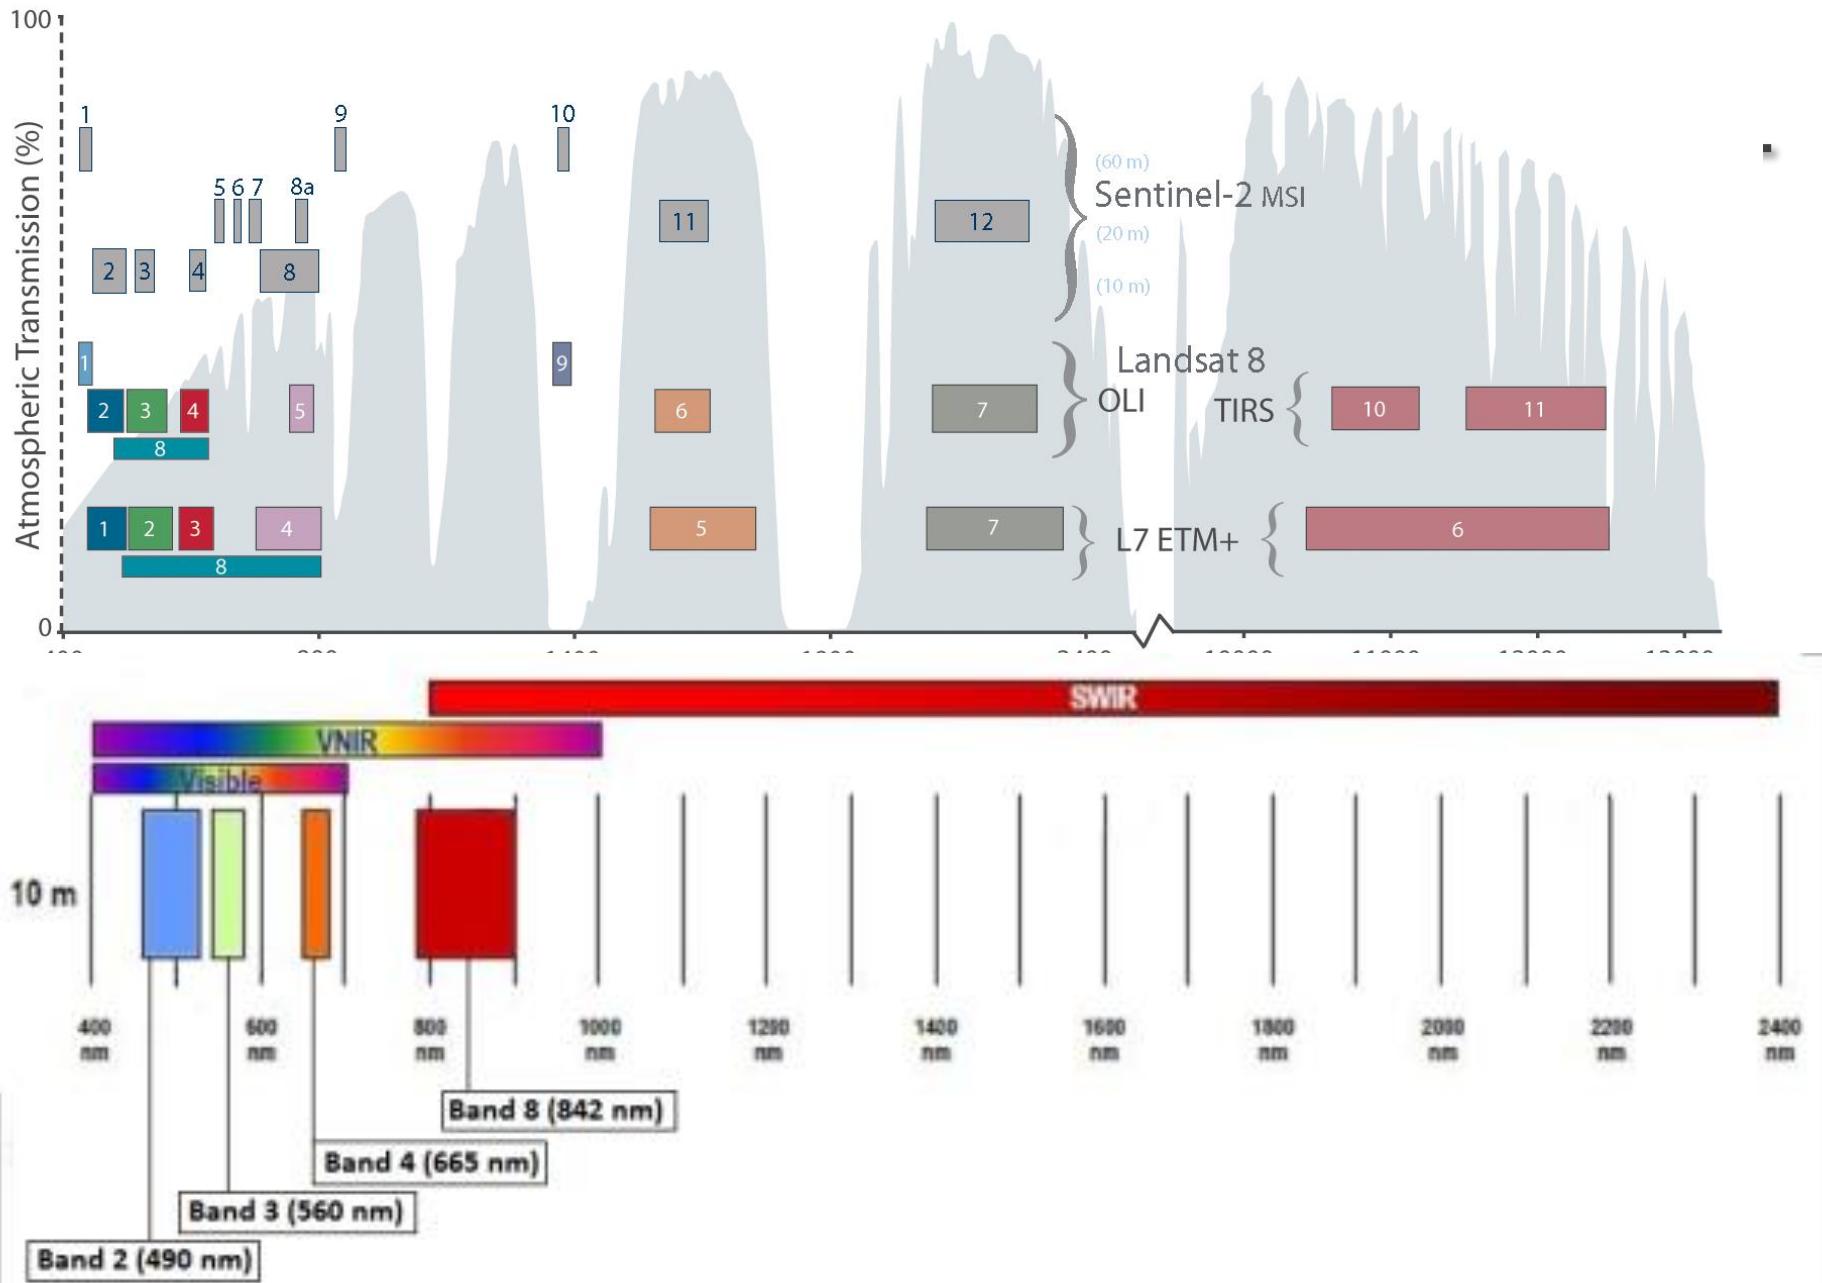

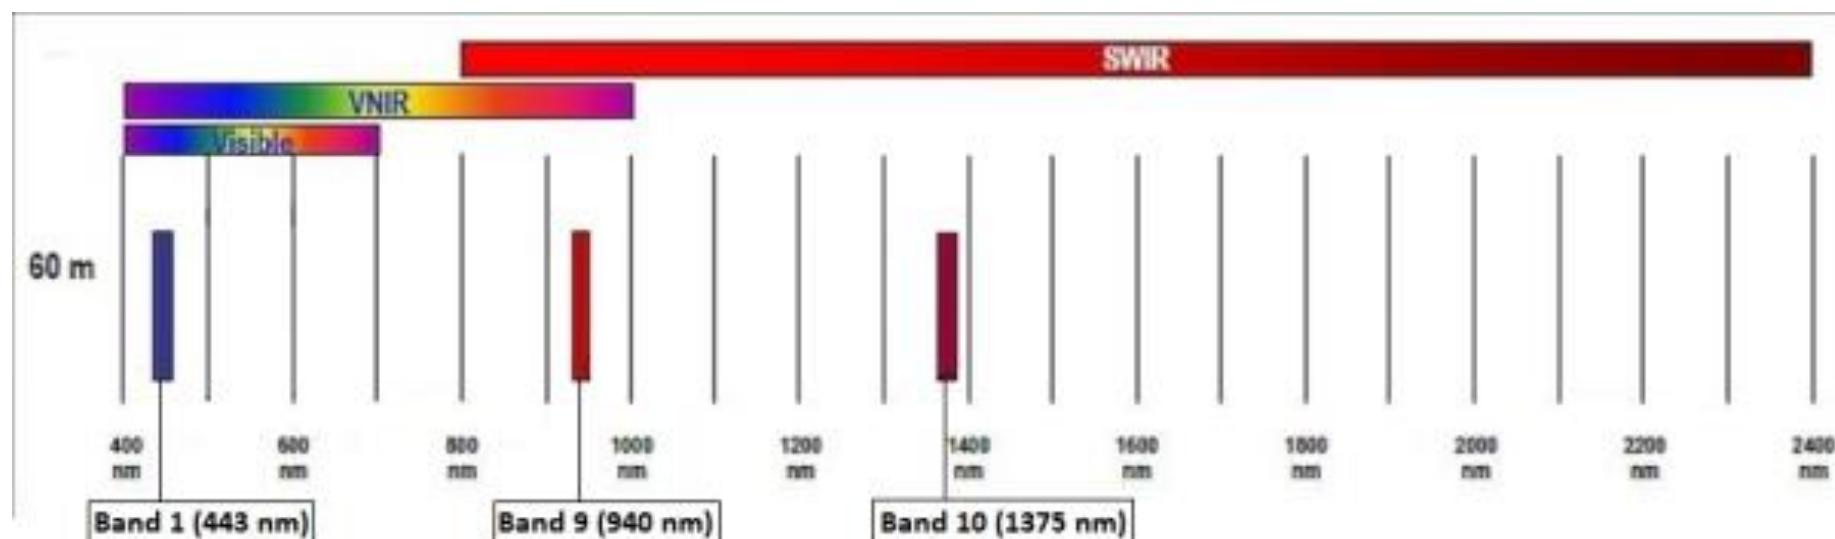

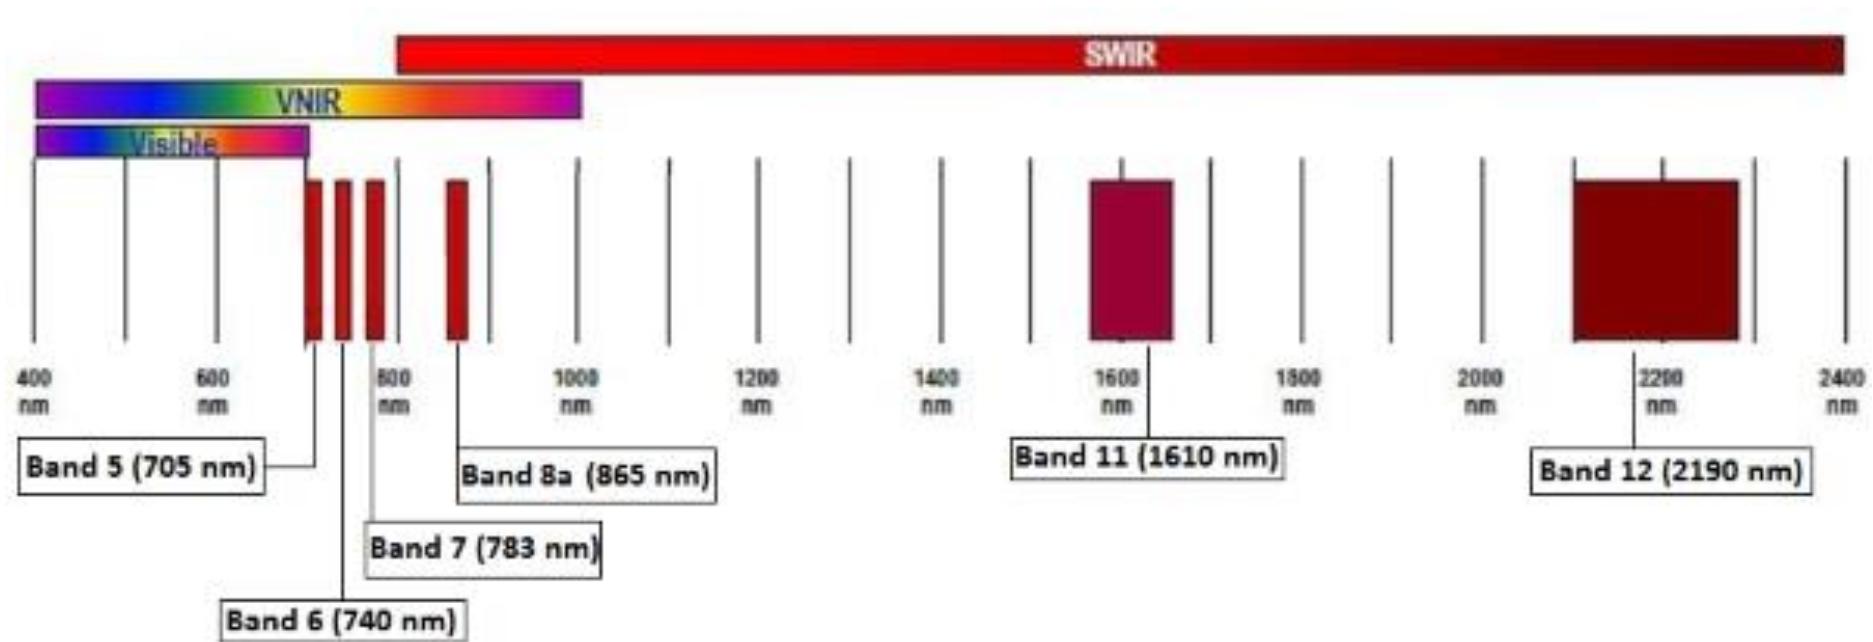

The **Sentinel-2** satellites are placed in the same sun-synchronous orbit, phased at 180° to each other, at an altitude of 786 km and an inclination of 98.5 degrees for 14.3 revolutions per day and a 10:30 Local Time of **Descending Node** that has been chosen to minimize cloud cover and ensure a good solar illumination of Earth's surface.

Sentinel-2 carries a single pushbroom sensor: the **Multispectral Imager (MSI)** that covers 13 spectral bands.
