STEADY STATE MODELS

Modeled components are **stable** - do not change over time

Gives information about **average values** of the modelled components or about certain conditions when the ecosystems are in equilibrium

Phytoplankton-dominant and vegetation dominant states in shallow lake

Critical implications for management

Phosphorus (μL)

There are
different
approaches

Chemostat model

Ecopath model

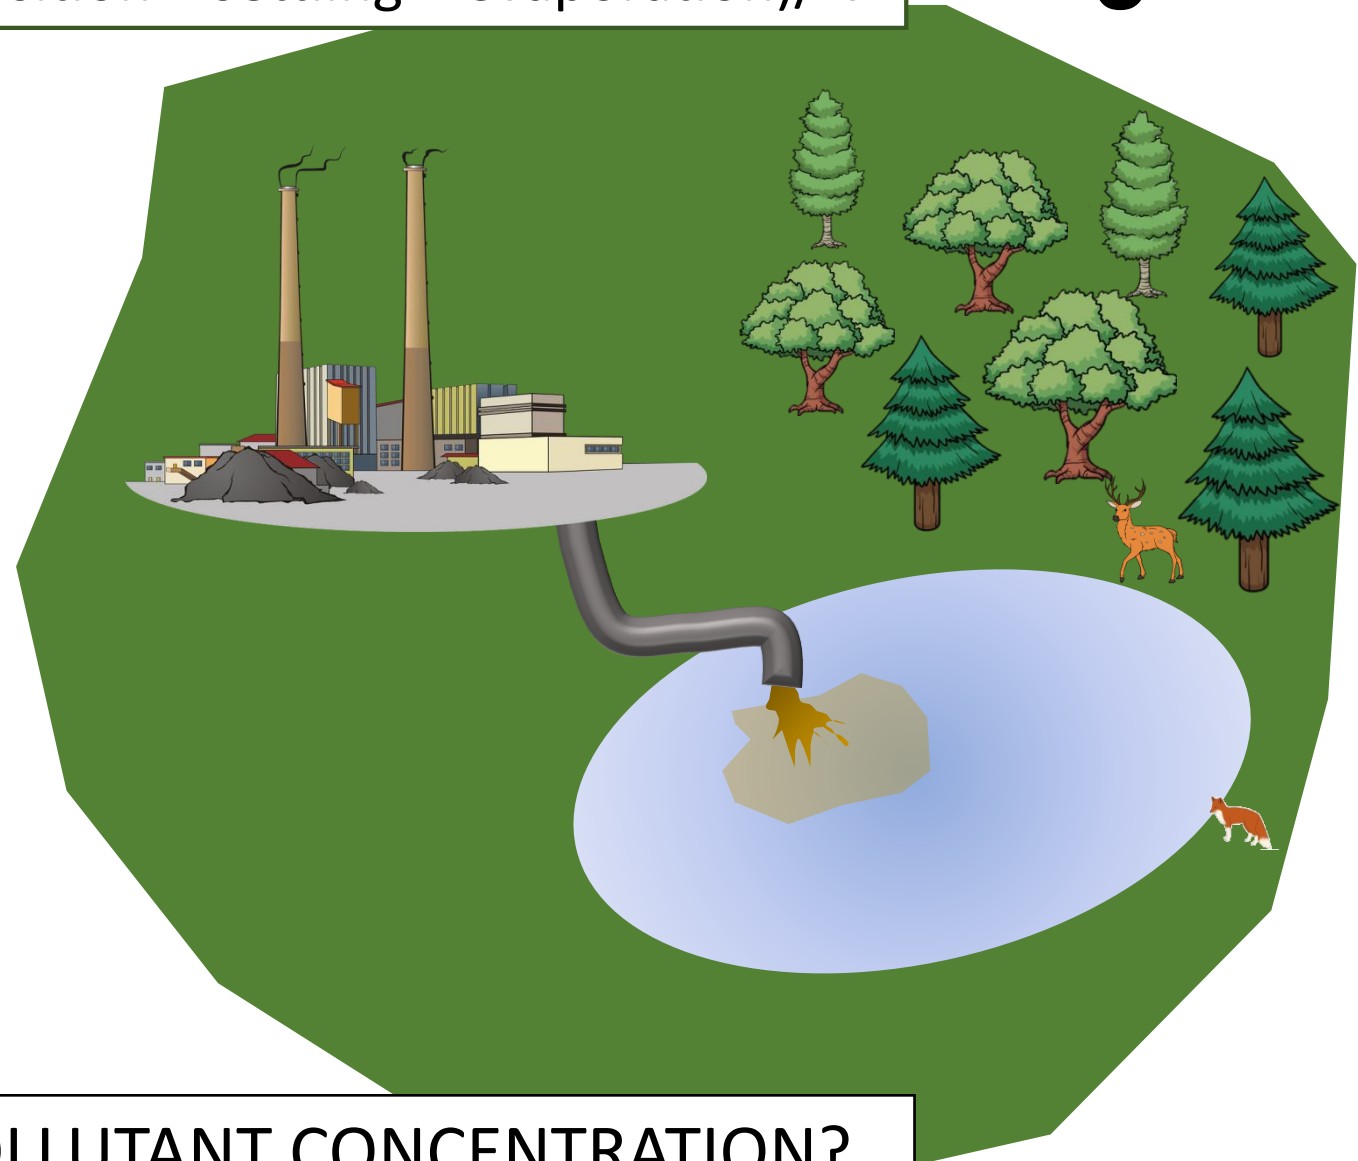

Ecological Network Analysis

$$Dc/dt = (\text{input} - \text{output} - \text{decomposition} - \text{settling} - \text{evaporation}) / V = 0$$

- Wastewater volume
- Pollutant concentration in the wastewater
- Half-life of the pollutant
- Volume of the lake
- ...

Chemostat

POLLUTANT CONCENTRATION?

Modeling trophic flows in the wettest mangroves of the world: the case of Bahía Málaga in the Colombian Pacific coast

Castellanos-Galindo GA, Cantera J, Valencia N, Giraldo S, Peña E, Kluger LC, Wolff M.

2017

Represent the interactions between the different components of the mangrove ecosystem

A model was created using Ecopath and its main equations:

Production = catch + predation mortality + net migration + biomass accumulation + other mortality

Consumption = production + respiration + unassimilated food

For each of the components there was an associated function based on several parameters

The source of these parameters were many:

- Published and unpublished research
- Data relative to relatively nearby and similar mangroves
- Calculated parameters

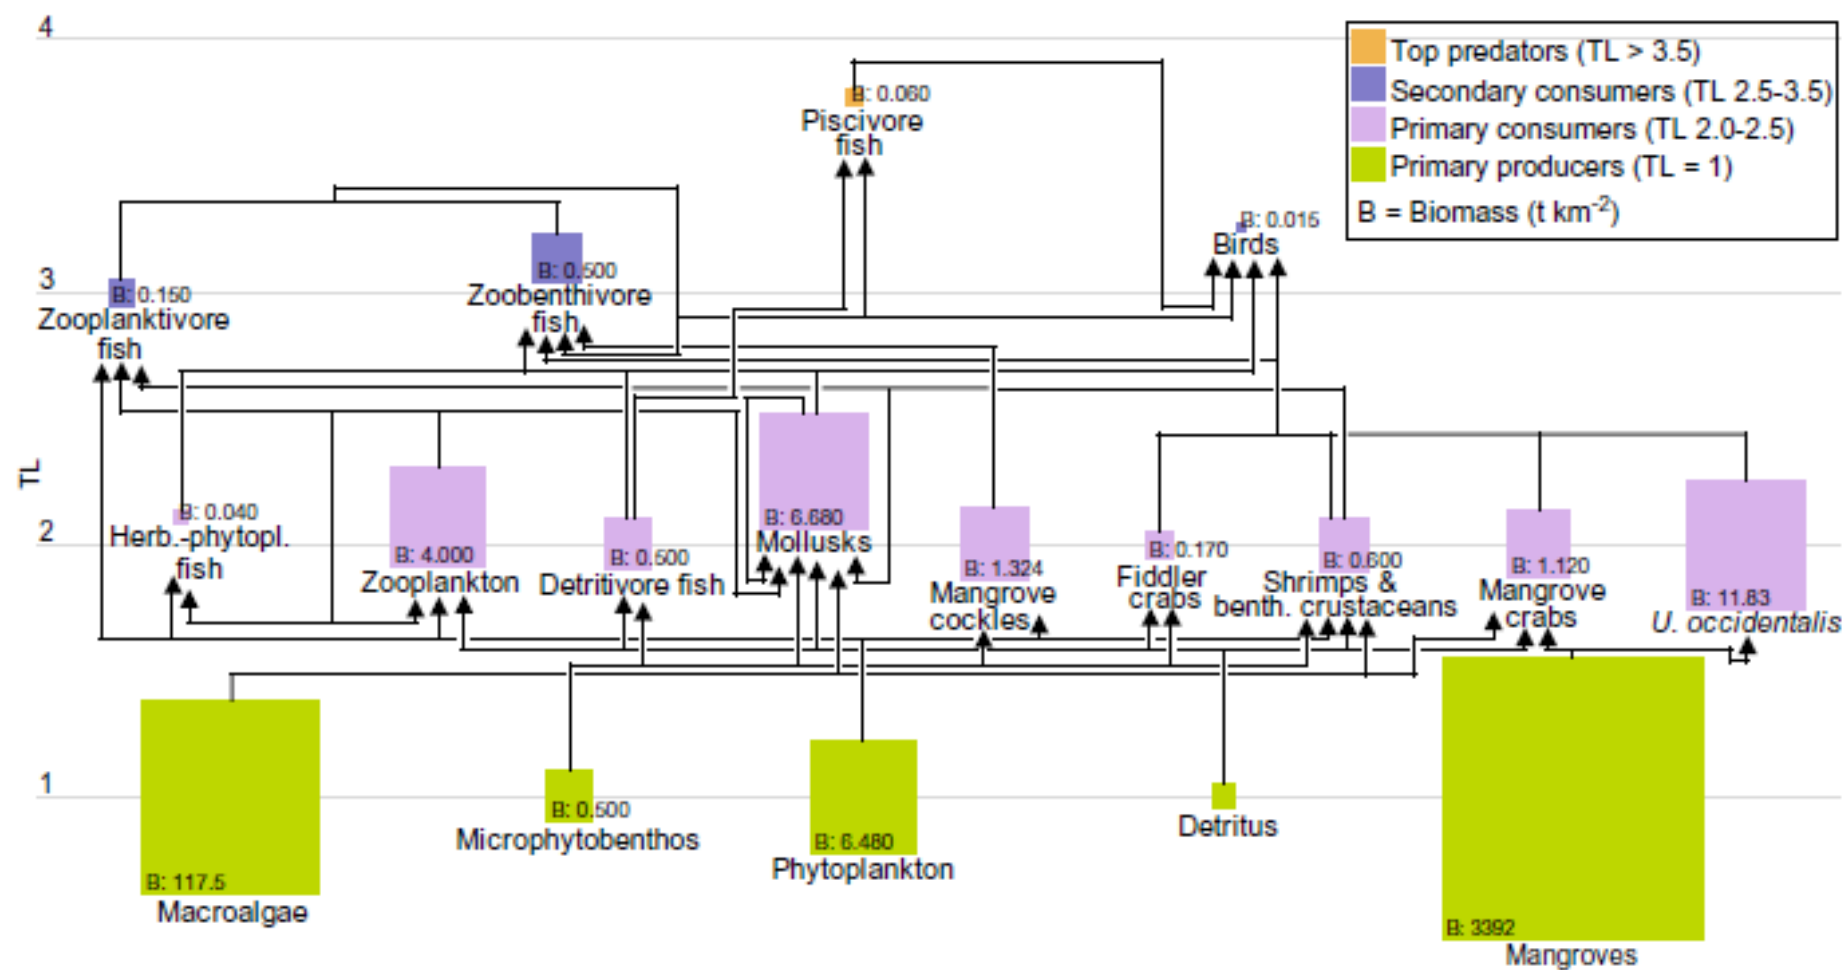

Fig. 3 Flow diagram of the estuarine mangrove system of Bahía Málaga in the Tropical Eastern Pacific as represented by its functional groups. The area of functional group's boxes is

scaled to the group's biomass (B), and the y-axis describes the trophic level (TL) as calculated by EwE

After the model creation, many indexes were estimated

These were then used to compare with other mangrove ecosystems

The results reveal a surprisingly low productive system that at the same time has very little human interventions.

Table 6 System characteristics and ecological network analysis (ENA) indices of mangrove ecosystems for which Ecopath models have been produced in the Neotropics

System characteristics	Bahía Málaga, Colombia	Gulf of Nicoya, Costa Rica	Golfo Dulce, Costa Rica	Caeté Estuary, Brazil	Terminos Lagoon, Mexico	Huizache-Caimanero Lagoon, Mexico
Biogeographic region	Eastern Pacific	Eastern Pacific	Eastern Pacific	Western Atlantic	Western Atlantic	Eastern Pacific
Tidal regime	Macrotidal	Mesotidal	Mesotidal	Macrotidal	Microtidal	Microtidal
Size (km ²)	160	1,530	750	220	2,500	175
Mangrove area (km ²)	50	135.16	20	99	1,270	4.28
Rainfall (mm year ⁻¹)	8,000	2,126	3,000–5,000	2,500	1,200–2,000	800–1,200
Functional groups	18	21	20	20	20	26
Mean trophic level of the catch	2.16	4.06	5.3	2.08	3.6	2.5
Mean transfer efficiency (%)	3.5	14.9	15	9.8	7	8.3
Finn cycling index (FCI)	1.43%	5.5%	18.9%	17.9%	7.0%	9.9%
Relative ascendancy (A/C) ^a	46.5%	26.1%	32.2%	27.4%	51.1	29.4%
Relative overhead (O/C) ^a	53.5%	73.9%	67.8%	69.6%	48.9%	70.7%
Redundancy ^a	%	56%	46.2%		36.1%	
Total system throughput (TST) ^a	7,042.9	3,049.3	1,404.6	10,558.6	3,709.5	6,668.6
Primary production/TST ^a	0.47	0.38	0.27	0.30	0.44	0.57
Consumption/TST ^a	0.13	0.38	0.48	0.35	0.11	0.31
Export/TST ^a	0.39	0.16	0.05	0.21	0.38	0.001
Total biomass of the community ^a	3,542.9	132.1	10.43	13,132.2	263.6	486.3

Ecological network analysis of growing tomatoes in an urban rooftop greenhouse

Piezer K, Petit-Boix A, Sanjuan-Delmás D, Briese E, Celik I, Rieradevall J, Gabarrell X, Josa A, Apul D.

2019

Objective: to create a sustainable rooftop greenhouse that produces beef-tomatoes based on the Ecological Network Analysis (ENA) model

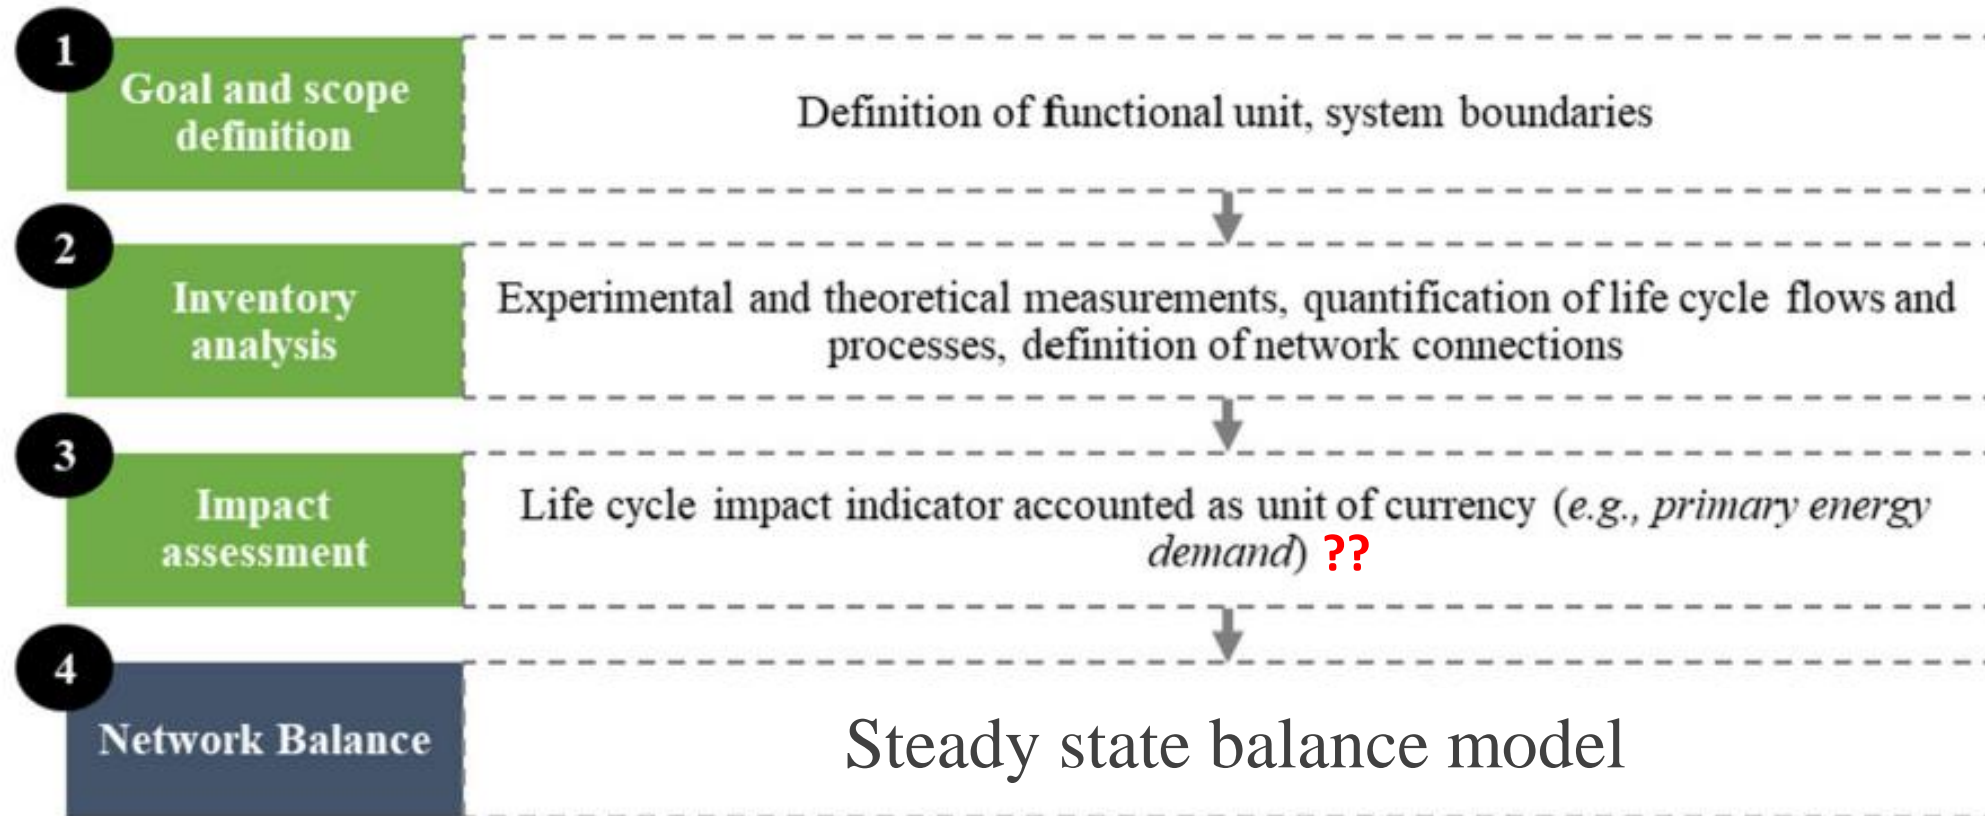

Traditionally it is use the **Life Cycle Assessment (LCA)** and the **input-output (IO) tables** as tools – overview of the material and energy flows trough systems.

Ecological Network Analysis (ENA)

How the hell does it work???

Truly, we don't know ;(but after maaaany readings we think it is like this...

Model calculations

OH GOD

WHY

5

Troughflow Analysis

Energy flows and consumption patterns throughout system
Flow matrix, TST, trophic level

System throughflow

$$T_i^{in} = \sum_{j=1}^n f_{i,j} + z_i \quad (\text{Eq. 1})$$

$$T_j^{out} = \sum_{i=1}^n f_{i,j} + y_j \quad (\text{Eq. 2})$$

$$TST = \sum_{j=1}^n T_j \quad (\text{Eq. 3})$$

Direct flow matrices

$$G = [g_{i,j}] = \frac{f_{i,j}}{T_j^{out}} \quad (\text{Eq. 4})$$

$$G' = [g'_{i,j}] = \frac{f_{i,j}}{T_i^{in}} \quad (\text{Eq. 5})$$

Integral flow matrices

$$N = (I - G)^{-1} \quad (\text{Eq. 6})$$

$$N' = (I - G')^{-1} \quad (\text{Eq. 7})$$

6

Network utility analysis

Direct and indirect energy exchange and interactions between compartments
Symbiotic relationships between compartments

Direct utilities matrix

$$D = [d_{i,j}] = \frac{(f_{i,j} - f_{j,i})}{T_i} \quad (\text{Eq. 8})$$

Indirect utilities matrix

$$U = (I - D)^{-1} \quad (\text{Eq. 9})$$

Network Mutual Index

$$\frac{\text{Sign } U (+)}{\text{Sign } U (-)} \quad (\text{Eq. 10})$$

7

Network control analysis

Control and dependence allocation for each compartment in the system
Graphical representation of relative power of each compartment

Control allocation matrix

$$CA = [ca_{i,j}] = \begin{cases} n_{i,j} - n'_{j,i} > 0, ca_{i,j} = \frac{n_{i,j} - n'_{j,i}}{\sum_{i=1}^n (n_{i,j} - n'_{j,i})} \\ n_{i,j} - n'_{j,i} \leq 0, ca_{i,j} = 0 \end{cases} \quad (\text{Eq. 11})$$

Dependence allocation matrix

$$DA = [da_{i,j}] = \begin{cases} n_{i,j} - n'_{j,i} > 0, da_{i,j} = \frac{n_{i,j} - n'_{j,i}}{\sum_{j=1}^n (n_{i,j} - n'_{j,i})} \\ n_{i,j} - n'_{j,i} \leq 0, da_{i,j} = 0 \end{cases} \quad (\text{Eq. 12})$$

Interpretation

Total energy flow
21.6Mj

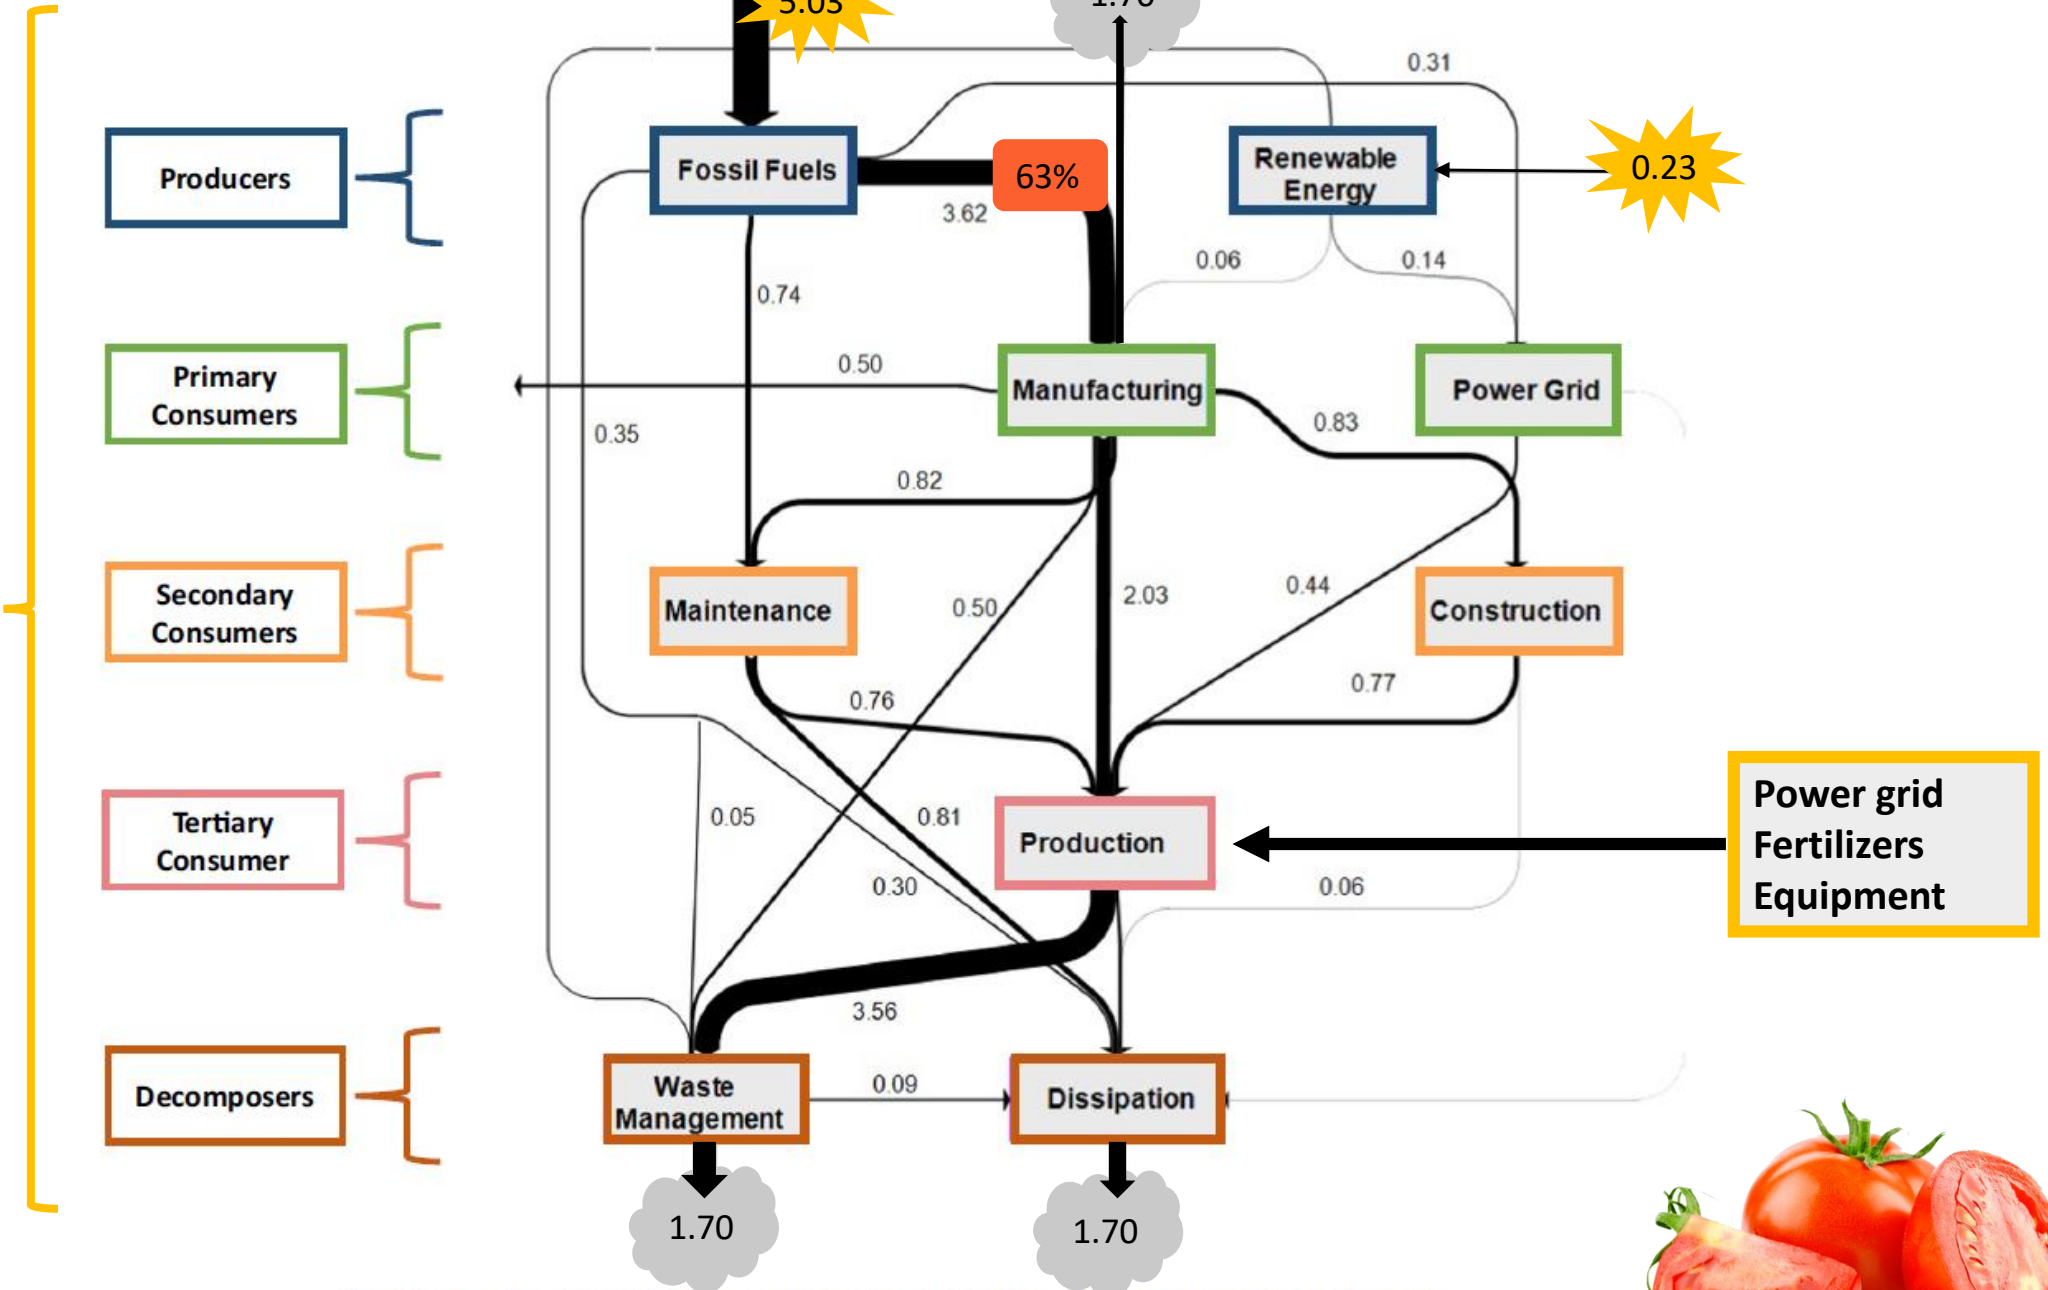

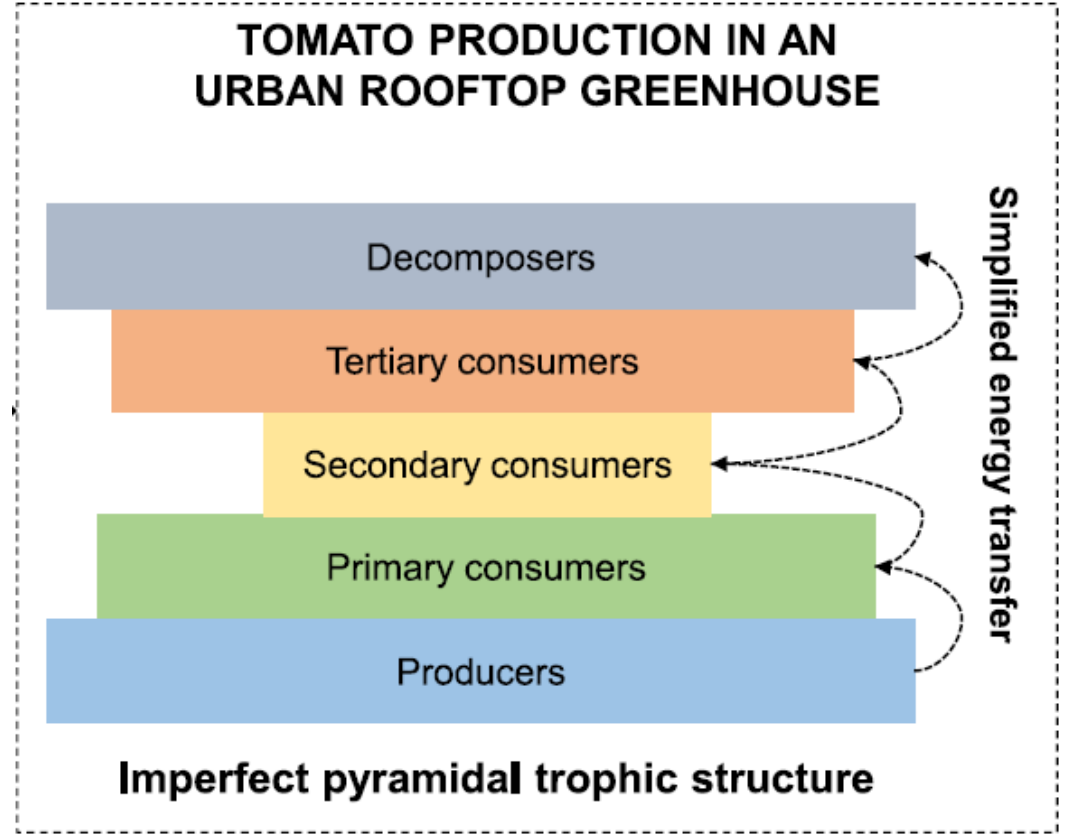

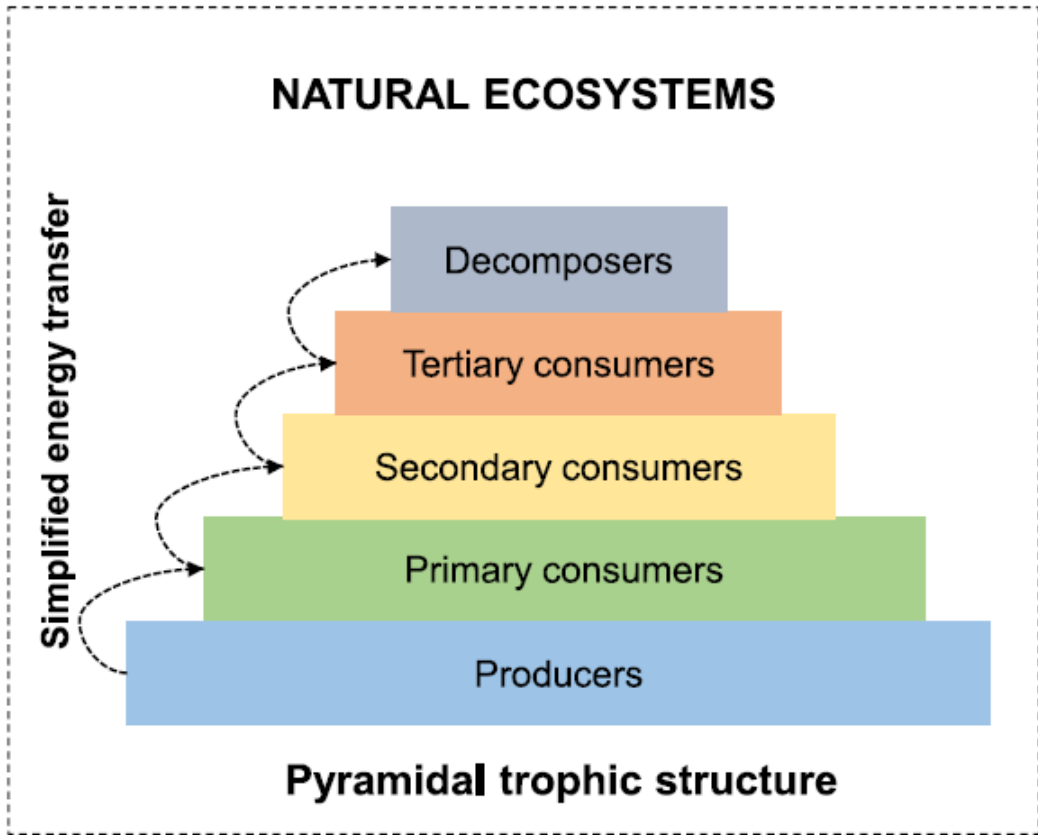

Fig. 3. Energy flows (in MJ) in the supply chain of the i-RTG. Data per functional unit (1 kg of tomato).

Conclusions

1. Identify the energy structure of an urban agricultural setting

2. Future → make improvements on the system and also to predict future behaviors

Natural Ecosystem vs Urban Agriculture System

Conclusions

1. Identify the energy structure of an urban agricultural setting

2. Future → make improvements on the system and also to predict future behaviors

OVERVIEW

Ecological
Network Analysis

Ecopath

Name

Assumptions
and
Inputs

Type of questions
answered

Basically the same thing...

OVERVIEW: Constraints

Assumes a “closed” system

Doesn't recognize ontogeny

But!
Can be fixed by using different age classes

Based on means and average values

May under or overestimate the
impact of harvest

OVERVIEW: Why you want to use them!

Whole system snapshot view

Complex interactions between trophic groups

Role of each component in the system

Quantification of trophic interactions, harvest rates and impacts and productivity

Great potential to model aquatic ecosystems

Thank you 😊
